UVOD

Register raka za SR Slovenijo je bil ustanovljen na pobudo Božene Ravnihar kot posebna služba za zbiranje in obdelavo podatkov o incidenci raka in preživetju rakavih bolnikov leta 1950 s tedaj izdano odredbo o obveznem prijavljanju raka v naši republiki. Zakon o zdravstvenem varstvu in o zdravstveni službi v SR Sloveniji (Ur. l. SRS, št. 14-15/65) je ponovno določil obveznost prijavljanja rakavih obolenj. Na podlagi tega zakona izdan Pravilnik o prijavi in kontroli rakavih bolnikov in o drugih tehničnih vprašanjih boja proti raku (Ur. l. SRS, 4/66) pa je to obveznost še podrobneje opredelil. Tudi sedanji Zakon o zdravstvenem varstvu (Ur. l. SRS, št. 1/80) je v 146. členu obdržal veljavnost navedenega Pravilnika.

Republiško zakonodajo podpira in dopolnjuje od 1. 1. 1986 dalje še zvezna (Ur. l. SFRJ, št. 76/85 in 3/86), ki je registracijo rakavih bolezni uvrstila med statistična raziskovanja pomembna za vso državo.

Incidenca raka je po svetu zelo različna. Tako tudi SR Slovenija kaže v obolevnosti za rakom svojo posebno sliko. Zbrani podatki so številčna podlaga za:

- ocenjevanje družbenega bremena rakavih bolezni v republiki,
- programiranje onkološkega varstva na področju primarne preventive, detekcije, diagnostike, terapije, rehabilitacije in usmerjanja glavnih udarcev boja proti raku,
- načrtovanje zmogljivosti in sredstev zdravstvenega varstva, ki so potrebna za obvladanje rakavih bolezni (kadri, medicinska oprema, posteljne zmogljivosti),
- preverjanje učinkovitosti ukrepov onkološkega varstva,
- klinične in epidemiološke raziskave, največkrat v sklopu širših mednarodnih raziskav.

Z rednimi vsakoletnimi poročili in posebnimi obdelavami podatkov želimo vzdrževati ta informacijski sistem za uporabnike živ. Prva letna poročila do vključno leta 1955 smo razmnoževali na ciklostilu ter jih dostavljali vsem bolnišnicam in republiškim zdravstvenim organom. V letu 1957 smo izdelali obsežnejše poročilo o incidenci raka in preživetju rakavih bolnikov za celotno petletno obdobje 1950—1955. To poročilo smo izdali tudi v angleškem jeziku v posebni, tiskani publikaciji: "Cancer in Slovenia, 1955", Oncological Institute, Ljubljana 1957. Zaradi finančnih in kadrovskih težav smo nadaljnja letna poročila, ki so obsegala le osnovne podatke o incidenci raka, pripravljali samo za republiški in zvezni zavod za zdravstveno varstvo in jih prek njiju dostavljali tudi Svetovni zdravstveni organizaciji. Le-ta jih je objavljala v svoji periodični publikaciji: "Epidemiological and Vital Statistics Report" (Vol. 14, No. 11, 1961; Vol. 16, No. 12, 1963; Vol. 17, No. 12, 1964; Vol. 19, No. 12, 1966;

Vol. 20, No. 12, 1967) oziroma v "World Health Statistics Report" (Vol. 23, No. 3, 1970; Vol. 24, No. 2, 1971; Vol. 25, No. 4, 5, 1972; Vol. 26, No. 8, 1973; Vol. 27, No. 6, 7, 1974). Z našimi podatki o incidenci raka v Sloveniji v letih 1956—1965, 1968—1972, 1973—1976 in 1978—1981 smo dali svoj prispevek tudi v knjigo: "Cancer incidence in Five Continents", UICC, Geneva (Vol. I-1966, Eds. Doll, R., Payne, P., Waterhouse, J.; Vol. II-1970, Eds. Doll, R., Muir, C.S., Waterhouse, J.) in IARC, Lyon (Vol. III-1976, Eds. Waterhouse, J.; Muir, C., Correa, P., Powell, J.; Vol. IV-1982, Eds. Waterhouse, J. et al.; Vol. V-v tisku). Vse naštetje publikacije so širšemu krogu naših zdravstvenih delavcev le težko dostopne. Ker pa je zanimanje naših strokovnjakov in raziskovalcev za podatke o pogostnosti raka pri nas vedno večje in vedno več povprašujejo po njih, od leta 1965 dalje letna poročila spet razmnožujemo in jih razpošiljamo zainteresiranim zdravstvenim zavodom v Sloveniji, v drugih republikah in v zamejstvu. Tako smo izdali poročila o incidenci raka v Sloveniji za leto 1965 do vključno 1982.

MATERIAL IN POJASNILO

Tabele tega poročila prikazujejo preliminarne podatke o incidenci raka v Sloveniji v letu 1983 po spolu, starosti, primarni lokalizaciji, histološki vrsti in stadiju ob diagnozi ter o incidenci po zdravstvenih regijah in območjih zdravstvenih domov, kot tudi podatke o številu novih primerov raka, ugotovljenih v tem letu po posameznih bolnišnicah. Zanesljivost podatkov osvetljujejo dva kazalca: odstotek primerov raka, registriranih samo iz zdravniških poročil o vzroku smrti in odstotek mikroskopsko (histološko ali citološko) potrjenih primerov. Slike 1—3 prikazujejo tiste podatke iz tega in preteklih poročil, ki naše uporabnike največkrat zanimajo: to je deset najbolj pogostnih lokalizacij raka po spolu ter trende incidence raka vseh in izbranih lokalizacij po spolu. Slike 4 do 6 prikazujejo podatke o preživetju bolnikov obolelih v letih 1973—1976. Za izračun odstotkov preživetja smo uporabili Berkson-Gagevo formulo, ki upošteva tudi bolnike, ki so se iz evidence izgubili (Proc. Staff Meet. Mayo Clin. 25:270, 1950).

Kot v poročilih za leto 1970 do vključno leta 1982 so tudi v tem poročilu primarne lokalizacije raka šifrirane po 8. reviziji Mednarodne klasifikacije bolezni (MKB), medtem ko so bile v prejšnjih poročilih šifrirane po 7. reviziji MKB. To moramo upoštevati pri primerjanju podatkov zadnjih 14 let s podatki prejšnjih let. Opozarjamo na vsebinske spremembe pri sledečih šifrah 8. revizije MKB: 143, 144, 145 in 146, 155 in 156, 162 in 163, 181 in 182, 188 in 189, 195, 197, 198 in 199 ter 202.

Incidenca pomeni število v enem koledarskem letu na novo ugotovljenih primerov raka, ki jih Registru prijavljajo bolnišnice (tudi, če je bila diagnoza rak ugotovljena šele pri obdukciji) ali zdravstveni do-

movi (v primeru, če bolnik z ugotovljenim rakom zaradi kakršnegakoli razloga ni napoten v bolnišnico ali pa sam to odklanja), plus število v istem letu umrlih, pri katerih je bil rak ugotovljen šele ob smrti in so prišli v evidenco Registra samo na podlagi zdravniškega poročila o vzroku smrti. Tudi v tem poročilu v incidenco nismo šteli novih primarnih rakov parnega organa iste lokalizacije, če je bila histološka vrsta obeh rakov, npr. leve in desne dojke enaka. To spremembo je treba upoštevati pri opazovanju trendov teh rakov od leta 1980 dalje. Tabela 5 prikazuje incidenco na 100 000 prebivalcev. Preračunana je na število prebivalstva SR Slovenije na dan 30. junija 1983 (tab. 1). To je dejanska incidenca na 100 000 prebivalcev, "Starostno standardizirana" incidenca (slika 2) pa izloča vpliv razlik v starostni strukturi prebivalstva v posameznih letih opazovanega obdobja, v našem primeru staranja prebivalstva SR Slovenije v letih 1950—1983. Izračunali smo jo po Day-evi metodi izračuna kumulativne incidence od 0. do vključno 74. leta starosti na 100 prebivalcev, ker so se stare metode direktne in indirektna standardizacije zaradi pačenja dejanskih rezultatov izkazale kot neprimerne (Cancer Incidence in Five Continents, Vol. IV, 1983, strani 668—670). Kumulativna incidenca na 100 prebivalcev je petkratna vsota starostno specifičnih incidenc na 100 prebivalcev posameznih petletnih starostnih skupin. Day jo opredeljuje kot direktno, na dejansko populacijo posamezne petletne starostne skupine standardizirano incidenco. Vrednosti tako izračunane kumulativne incidence so sicer drugačne kot vrednosti dejanske incidence na 100 000 prebivalcev. Primerjava oblike krivulj pa nam kaže, da lahko staranju našega prebivalstva pripišemo naraščanje raka predvsem pri ženskah, medtem ko pri moških očitno k temu prispevajo še drugi dejavniki.

V tabeli 7 je navedeno število vseh mikroskopsko, to je histološko ali citološko potrjenih novih primerov raka, medtem ko so v tabeli 8 navedeni samo primeri, ki so histološko potrjeni. Zato vsoti vseh mikroskopsko potrjenih primerov v tabeli 7 in vseh primerov v tabeli 8 nista enaki. Histološke vrste so šifrirane po šifrantu ICD-O (international Classification of Diseases for Oncology, WHO 1975). V tabeli 10 so zaradi enotnosti maligni limfomi in levkemije opredeljeni v iste stadije kot solidni tumorji. Pri tem so maligni limfomi dosledno uvrščeni takole: I. stadij v lokaliziran, II. stadij v regionarno razširitev ter III. in IV. stadij v oddaljeno razširitev. Vse levkemije so uvrščene v oddaljeno razširitev. Ekstranodalne lokalizacije malignih limfomov so uvrščene med ustrezne primarne lokalizacije raka.

V tabele so vključeni le podatki o bolnikih, ki imajo stalno bivališče na območju SR Slovenije ne glede na to kje so bili zdravljeni.

ZAHVALA

Zahvaljujemo se vsem zdravnikom, medicinskim sestram in administrativnemu osebju, ki so nam vestno in redno pošiljali podatke o novoobolelih rakavih bolnikih in njihovi nadaljnji usodi. Prav posebej pa se zahvaljujemo sodelavkam Bolnišničnega registra Onkološkega inštituta v Ljubljani: Ani Dotzauer, Boži Kolar, Mariji Kralj, Marini Stančič, Anici Sovdat in Nadi Jamšek, ki so z vodenjem evidence in s skrbnim izpisovanjem in šifriranjem podatkov iz popisov bolezni prispevale vsaj polovico v tem poročilu obdelanih podatkov. Dragocena je bila tudi občasna pomoč Epidemiološke službe našega inštituta: Maje Primic Žakelj, Ane Polajnar in Marije Zakrajšek.

INTRODUCTION

The Cancer Registry of Slovenia was founded on the initiative of Božena Ravnihar in 1950 as a unit of the Institute of Oncology, Ljubljana. The registry is population-based, as all diagnosed cancer cases are subject to compulsory notification in the Socialist Republic of Slovenia, situated in the northwest part of Yugoslavia.

The annual statistical reports on cancer incidence in Slovenia for the years 1950-1955 were mimeographed and distributed to all hospitals and health centers in Slovenia, as well as to the state health agencies. In 1957 a more comprehensive report was issued, which was also published in English in a limited number of copies (Ravnihar B. and staff of the Registry: *Cancer in Slovenia, 1955*, Oncological Institute, Ljubljana 1957). In that publication the cancer incidence data and the end results for the period 1950-1955 have been presented. Since 1957, because of the financial and personnel difficulties, the annual reports with basic statistical data have been prepared only for the Republic and Federal health agencies through which they were submitted to the World Health Organization for publication in the periodical *Epidemiological and Vital Statistics Report* (Vol. 14, No. 11, 1961; Vol. 16 No. 12, 1963; Vol. 17, No. 12, 1964; Vol. 19, No. 12, 1966; Vol. 20, No. 12, 1967), and later on in the *World Health Statistics Report* (Vol. 23, No. 3, 1970; Vol. 24, No. 2, 1971; Vol. 25, No. 4, 5, 1972; Vol. 26, No. 8, 1973; Vol. 27, No. 6, 7, 1974). The Registry has also contributed cancer incidence data of Slovenia for the periods 1956-1960, 1961-1965, 1968-1972, 1973-1976 and 1978-1981 to the publication *Cancer Incidence in Five Continents*. UICC, Geneva (Vol. I-1966, Eds. Doll, R., Payne, P., Waterhouse, J., and Vol. II-1970, Eds. Doll, R., Muir, C. S., Waterhouse,) and IARC Lyon (Vol. III-1976, Eds. Waterhouse, J., Muir, C., Correa, P., Powell, J., Vol. IV-1982, Eds. Waterhouse, J. et al. Vol. v — in press). However, because these publications are not available to the majority of the Slovene medical profession, it was decided to issue Registry's annual reports in the present form. These reports are principally intended for the medical profession and health institutions in Slovenia which have furnished the Registry with the required data. The tables have also been headed in English for the benefit of professional people abroad. Until now eighteen such reports have been issued, i.e. for the years 1965 to 1982 incl.

MATERIAL AND COMMENTS

The tables in this report present preliminary figures on cancer incidence in Slovenia in 1983 according to sex, age, primary site, histologic type, and stage of disease at diagnosis, as well as by health regions and subregions. The reliability of our cancer incidence data is indicated by the proportion of cases registered from death certificate only, and by the proportion of microscopically confirmed cases. In addition, the number of new cancer cases diagnosed in particular hospital is given as it might be of special interest to the hospital medical staff responsible for cancer notification.

Fig. 1-3 represent the data on most frequent cancer sites and their trends. A special presentation of cancer patient survival rates is added (Fig. 4-6). The Berkson-Gage formula has been used for calculating the survival rates (*Proc. Staff Meet. Mayo Clin.* 25:270, 1950).

As already in our previous reports on cancer incidence from 1970 till 1982 in the present report the primary sites of malignant neoplasms are coded according to the 8th revision of the International Classification of Disease (ICD). This fact has to be taken into account when comparing the annual cancer incidence data of these last fourteen years with those of the previous years which were coded according to the 7th revision of the ICD.

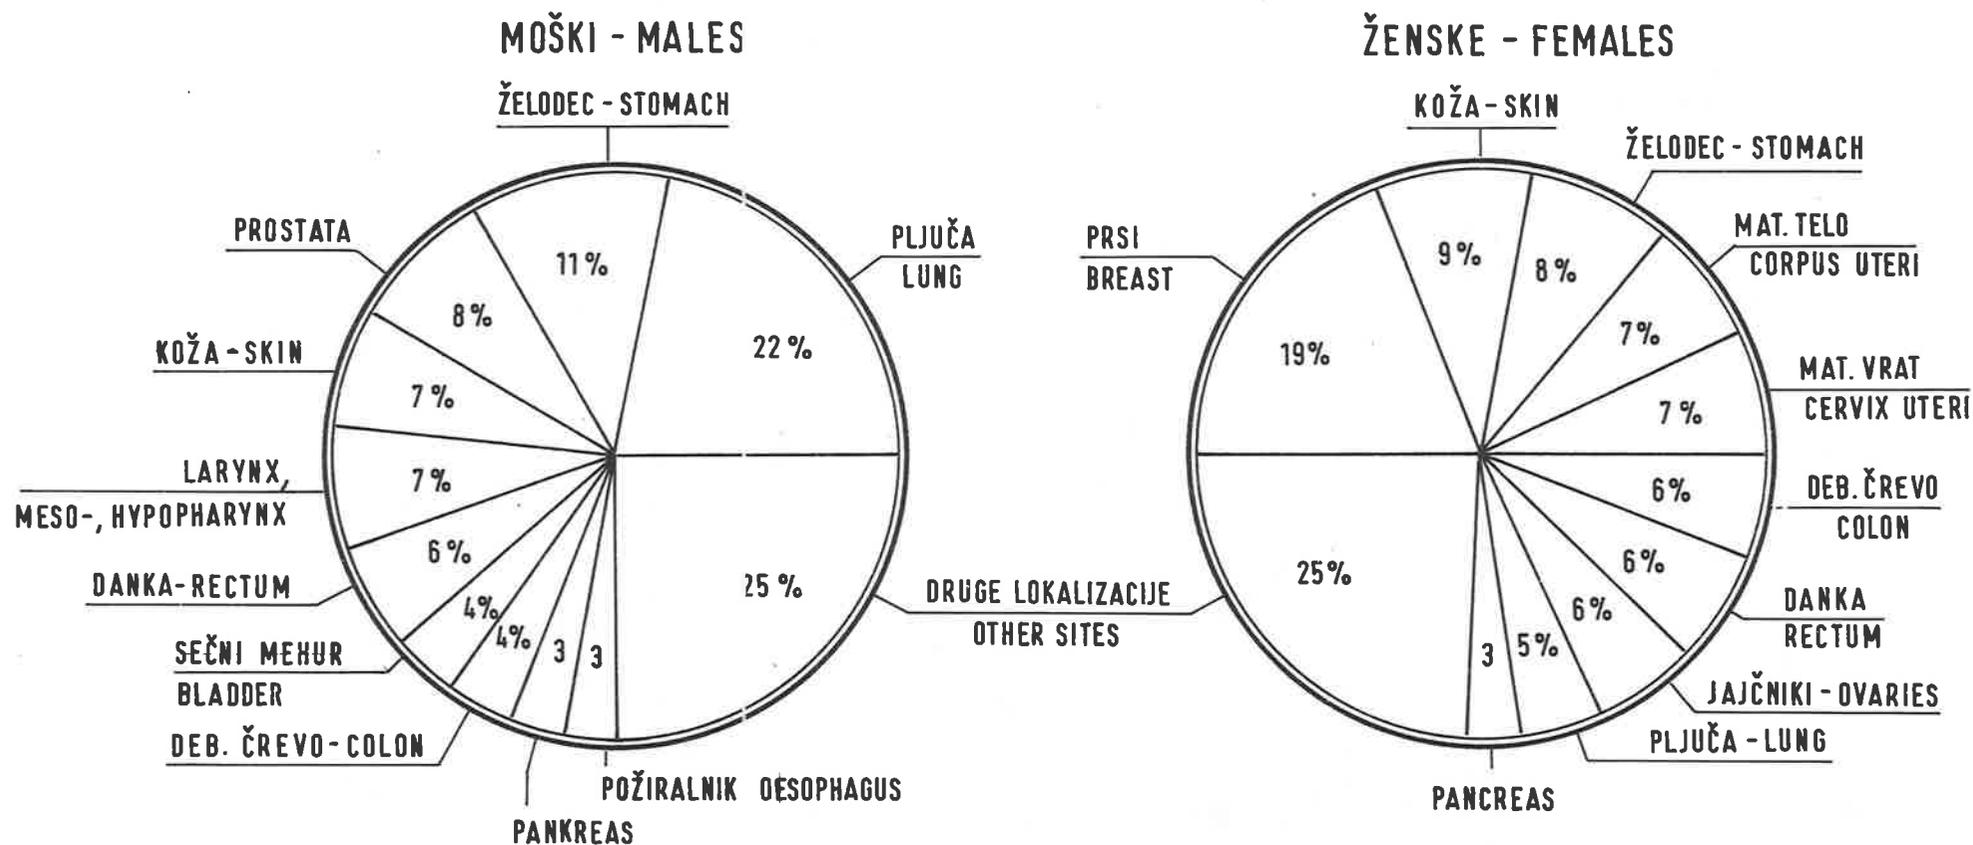

Incidence is determined as the number of notified cancer cases diagnosed during the relevant year including the number of individuals dying with cancer during the same year and who had not been previously reported to the Registry. In this report multiple primary cancers of the same histology in paired organs are not included in the incidence figures any more. This modification has to be taken into account especially in interpretation of breast cancer incidence data from the year 1980 on as compared to the previous years. The incidence rates refer to the number of Slovenia population on 30th June 1983 given in table 1.

For the standardization of crude incidence rates the Day's method of calculation, the cumulative rates per 100 population was used (*Cancer Incidence in Five Continents*, Vol. IV, 1982, pp. 668-670). Table 7 presents the number of all microscopically, i.e. histologically or cytologically verified new cancer cases, while in Table 8 only the histologically confirmed cases are included. Consequently there is a difference in totals between Table 7 and 8. Histological type is coded according to ICD-O (*International Classification of Diseases for Oncology*, WHO 1975). The extranodal sites of malignant lymphoma are included in the corresponding primary sites of cancer.

The presented data refer only to residents of Slovenia. Nonresidents, though reported to the Registry, are not included in this Report.
