## Counting edge-transitive, one-ended, three-connected planar maps with a given growth rate

Tomaž Pisanski

### Abstract

B. Grünbaum and G. C. Shephard have classified one-ended, 3-connected, planar, edge-transitive maps. It turns out that each of these maps can be described uniquely by an edge-symbol  $(p, q; k, l)$ . Recently the growth rate of each of these maps has been determined by S. Graves, T. Pisanski and M. E. Watkins. We determine the number of edge-transitive maps for a given growth rate.

**Keywords:** Tessellation, edge-transitive, Bilinski diagram, exponential growth, enumeration.

# **Štetje povezavno-tranzitivnih, enovitih, tri-povezanih ravninskih zemljevidov z dano hitrostjo rasti**

## **Abstract**

B. Grünbaum in G. C. Shephard sta klasificirala enovite, 3-povezane, ravninske, povezavno-tranzitivne zemljevide. Izkaže se, da se da vsakega od teh zemljevidov enolično opisati s povezavnim simbolom  $(p, q; k, l)$ . Nedavno so hitrost rasti vsakega od teh zemljevidov določili S. Graves, T. Pisanski in M. E. Watkins. V tem članku določimo število povezavno-tranzitivnih zemljevidov z dano hitrostjo rasti.

**Ključne besede:** Tlakovanje, povezavno-tranzitiven, diagram Bilinskega, eksponentna rast, enumeracija.
