

15 KMETIJSTVO IN RIBIŠTVO
AGRICULTURE AND FISHING

št./No 6

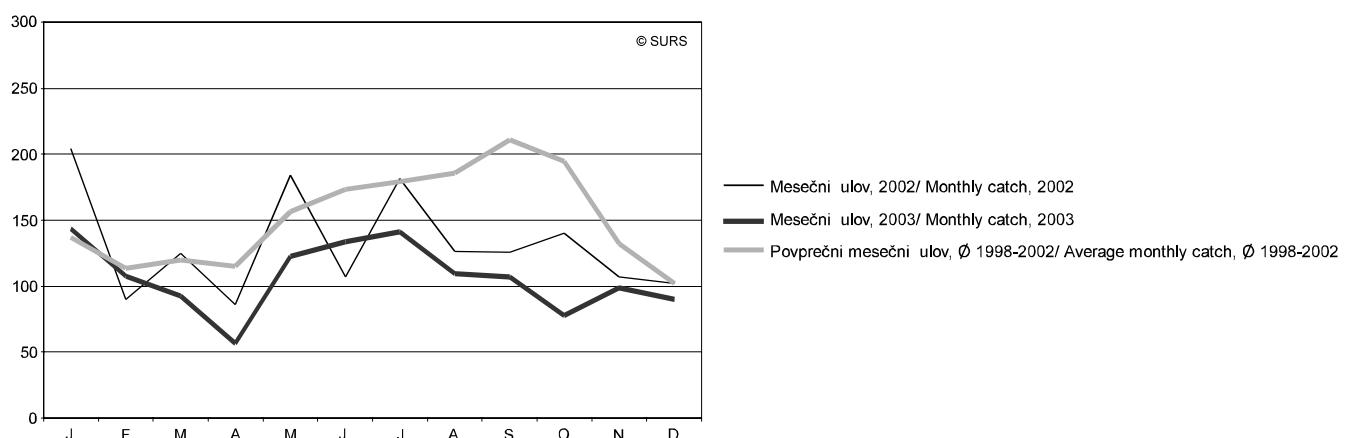

MORSKO RIBIŠTVO, SLOVENIJA 2003
MARINE FISHING, SLOVENIA 2003

- V letu 2003 so morski ribiči in ribogojci ulovili in vzredili 1282 ton morskih živali. Ulovljene morske živali so tehtale 1076 ton, vzrejene rive in školjke pa 206 ton. V primerjavi z letom 2002 se je morski ribolov zmanjšal za 26,3 %, marikultura pa se je povečala za 71,9 %. Ulov in vzreja skupaj sta bila za 18,9 % slabša kot v letu 2002.
- Izredno slab ulov plavih rib je močno vplival na rezultate v morskem ribolovu kakor tudi na rezultate morskega ribištva v celoti. V sestavi morskega ribolova zavzema delež drobnih pelagičnih rib že nekaj let več kot 90 %. V letu 2003 je ta delež obsegal le 79 % oziroma za 11,2 odstotne točke manjši kot v letu 2002.
- Marikultura pa še nikoli ni bila tako uspešna kot v letu 2003. Poleg klapavic, brancinov in orad so v lanskem letu začeli vzrejati še morske liste in ovčice. V skupni masi ulovljenih in vzrejenih morskih živali v letu 2003 je delež marikulture dosegel 16,1 %.
- In 2003 marine fishermen and fish farmers caught and bred 1,282 tons of marine animals. The total mass of caught marine animals was 1076 tons while the total mass of bred fish and shells was 206 tons. In comparison with 2002 the catch on the sea was down by 26.3% and mariculture was up by 71.9%. Total production of marine fishing and mariculture was down by 18.9%.
- The remarkable low catch of pelagic fishes had a strong influence on the results of marine fishing as well as on the results of total marine fishing production i.e. fishing and mariculture. In the structure of marine fishing the share of small pelagic fishes has been for the last few years more than 90%. In 2003 it was only 79% or 11.2 percentage points lower than in 2002.
- Mariculture has never been as successful as in 2003. In addition to Mediterranean mussels, European seabass and Gilthead seabream the breeding of Common sole and Sand steenbras has started in the previous year. In the total production of marine fishing and mariculture the share of last one reached 16.1%.

METODOLOŠKA POJASNILA**Namen statističnega raziskovanja**

Na podlagi zbranih podatkov prikazujemo mesečno maso ulova in vzreje morskih živali. V raziskovanju je zajetih 66 vrst plavih in belih rib in približno 10 vrst glavonožcev, rakov, školjk in polžev, ki jih ribiči lovijo v slovenskih ali mednarodnih vodah, in 5 vrst rib in školjk, ki jih ribogojci in školjkarji gojijo v urejenih gojitvenih objektih.

METHODOLOGICAL EXPLANATIONS**Purpose of the survey**

On the basis of collected data we show the monthly marine catch and mariculture. Reports cover 66 types of pelagic and demersal fishes and about 10 types of cephalopods, crustaceans, shells and snails fishermen catch in Slovene and international waters and three types of fish and shells breed at breeding sites.

Enota opazovanja

so podjetja in družbe, ki se ukvarjajo z ulovom ali vzrejo morskih rib in školjk, in registrirani zasebni ribiči, ki jim je ribolov glavna ali dopolnilna dejavnost. Če več samostojnih ribičev lovi skupaj uporabljoč isto ribiško plovilo (ista plovila), jih štejemo kot eno opazovano enoto.

Viri in zajetje podatkov

Podatke o ulovu in vzreji morskih rib, glavonožcev, rakov in školjk zbiramo z mesečnimi poročili o morskem ribolovu, ki jih izpoljujejo podjetja, družbe in zasebni ribiči, ki so registrirani za opravljanje gospodarskih dejavnosti v ribištvu.

Definicije

Morsko ribištvo je gospodarska dejavnost, ki se ukvarja z lovjenjem morskih živali.

Marikultura je gospodarska dejavnost, ki se ukvarja z vzrejo morskih živali.

Z ulovom morskih živali je prikazana količina ulovljenih rib, glavonožcev, rakov in/ali školjk ter količina vzrejenih belih rib in školjk.

Ribe delimo po načinu ulova in okolju, v katerem živijo, v dve podskupini, na plave in bele ribe:

Plave (drobne pelagične) ribe lovijo ribiči z večjimi plovili na odprttem morju in so posebno pomembne za industrijsko predelavo (konzerve); prevladujejo sardele.

Bele (pridnene ali bentonske) ribe lovijo ribiči z manjšimi plovili in pridnenimi (talnimi) mrežami v bližini obale; najpogosteji so moli in ciplji.

Indeksi mase ulovljenih morskih živali veljajo za tiste, ki so jih ribiči ulovili v opazovanem mesecu.

KOMENTAR

Morski ribiči in ribogojci so v letu 2003 ulovili in vzredili 1076 ton rib, 200 ton mekužcev (138 ton školjk in 62 ton glavonožcev) ter 6 ton rakov. Skupno je to 1 282 ton morskih živali, kar je za 18,9 % manj kot v letu 2002 in najmanj po letu 1992.

Observation units

are enterprises and companies dealing with catch and breeding of marine fish and shells and registered private fishermen whose main or supplementary activity is fishing. If a few fishermen catch together using the same fishing vessels, they are considered as one observation unit.

Sources and coverage of data collection

Data on catch and breeding of marine fish, cephalopods, crustaceans and shells are collected with monthly reports on marine fishing filled in by enterprises, companies and private fishermen registered in economic activity of catching or breeding marine animals.

Definitions

Marine fishing is an economic activity of catching marine animals.

Mariculture is an economic activity of breeding marine animals.

Catch of marine animals shows the quantity of unloaded fish, cephalopods, crustaceans and/or shells and the quantity of removed mariculture.

Fish are divided by the method of fishing and the environment in which they live into two subgroups, pelagic and demersal fishes.

Pelagic fishes, European pilchard prevailing, are fished with bigger vessels on the open sea and are especially important for manufacturing (tins).

Demersal fishes which fishermen catch with smaller vessels and ground nets near the coast; European hake and mullets are most common.

Indices of caught marine animals represent animals caught in the observed month.

COMMENT

In 2003 marine fishermen and fish farmers caught and bred 1,076 tons of fishes, 200 tons of molluscs (138 tons of shells and 62 tons of cephalopods) and 6 tons of crustaceans. This is 1,282 tons of marine animals or 18.9% less than a year before and the least of all since 1992.

Na mesec je bilo povprečno ulovljenih in vzrejenih okoli 107 ton, morskih živali kar je za 25 ton manj kot v letu 2002 in za 41 ton manj kot v letu 2001. V marcu, aprilu, oktobru, novembru in decembru je bila skupna masa ulovljenih in vzrejenih rib manjša od letnega povprečja, največja pa je bila v januarju, z letnim maksimumom 144 ton. Mesečno povprečje iz leta 2002 (132 ton) pa je bilo preseženo le v januarju, juniju in juliju.

Slabo kaže predvsem morskem ribolovu, ki je z 84-odstotnim deležem skupne mase ulovljenih in vzrejenih morskih živali v letu 2003 še vedno prevladujoča gospodarska dejavnost v morskem ribištvu. Ulov morskih živali se je v primerjavi z letom 2002 zmanjšal za 26,3 % predvsem zaradi 35,5-odstotnega slabšega ulova plavih rib. Ta padec je, med drugim, posledica zmanjšanega števila ribiških plovil, s katerimi ribiči lovijo te ribe. Ublažil ga je precej dober ulov belih rib, ki se je v istem obdobju povečal za 77,4 %. V decembru 2003 so ribiči prvič ulovili več belih (29 ton) kot plavih rib (27 ton). Ta mesec je skupina 34 ribičev ulovila 20 ton cipljev v piranskem zalivu.

V letu 2003 so bili rejci rib in školjk uspešnejši kot ribiči. Povečali so vzrejne kapacitete in dopolnili vzrejni program. Skupaj so vzredili 71 ton rib in 135 ton školjk, kar je za 71,9 % več kot v letu 2002 in največ po letu 1992.

The monthly average mass of caught and bred marine animals was about 107 tons, which is 25 tons less than the monthly average mass of 2002 and 41 tons less than the monthly average mass of 2001. Total marine fishing production in March, April, October, November and December was under the yearly average, while January is with 144 tons the year's maximum production. The monthly average of 2002 (132 tons) was surpassed only in January, June and July.

The prospects for marine fishing, which is the dominate economic activity with the 84% share of total marine fishing production in 2003, are not bright. It seems that certain problems have been present. Compared to 2002 the mass of caught marine animals decreased by 26.3% mainly because the mass of pelagic fishes was down by 35.5%. Among other, this decrease was caused by reduction of vessels for fishing the pelagic fishes. The mass decrease of caught marine animals was relieved with a rather good catch of demersal fishes that increased by 77.4% in the same period. In December 2003 for the first time we noted a bigger mass of caught demersal fishes (29 tons) than of pelagic fishes (27 tons). This month the group of 34 fishermen caught 20 tons of Mullets in the Bay of Piran.

In 2003 fish farmers and shell farmers were more successful than fishermen. They enlarged the breeding facilities and completed the breeding program. They produced 71 tons of fishes and 135 tons of shells, which is 71.9% more than in 2002 and most since 1992.
