A note on enumeration on one-vertex maps

Alen Orbanić, Marko Petkovšek, Tomaž Pisanski, Primož Potočnik

Abstract

Explicit formula for the numbers of distinct maps and pre-maps having a single vertex of valence d are given. The question of what precisely is meant by a map can be answered in several different ways. We enumerate 16 different types of objects where each type is obtained by selecting whether the object is a pre-map or a map, is oriented or general, whether the underlying graph or pre-graph is signed or unsigned, is directed or undirected.

Keywords: Oriented maps and pre-maps, orientable maps and pre-maps, non-orientable maps and pre-maps, pre-graphs, matchings in complete graphs, Cauchy-Frobenius-Burnside lemma.

Opomba o enumeraciji enovozliščnih zemljevidov

Povzetek

Podana je eksplisitna formula za števila različnih zemljevidov in pred-zemljevidov z enim samim vozliščem, ki ima stopnjo d . Odgovorov na vprašanje, kaj natanko pomeni zemljevid, je veliko. Naštejemo 16 različnih tipov objektov, določenih z naslednjimi izbirami: ali je objekt pred-zemljevid ali zemljevid, ali je orientiran ali splošen, ali je njegov osnovni graf ali pred-graf predznačen ali nepredznačen, usmerjen ali neusmerjen.

Ključne besede: Orientirani zemljevidi in pred-zemljevidi, neorientabilni zemljevidi in pred-zemljevidi, pred-grafi, parjenja v polnih grafih, Cauchy-Frobenius-Burnside-ova lema.
