Slovenia's population today and tomorrow, 2008-2060

EUROPOP2008
population projections for Slovenia

Ljubljana, July 2009

FOREWORD

Probable future development of Slovenia's population

Our latest publication on Slovenia's population - entitled *Slovenija's Population Today and Tomorrow, 2008–2060* - brings the results of Eurostat's EUROPOP2008 population projection for Slovenia, the baseline variant, which, taking into account the starting points and value of hypotheses about fertility, mortality and migration, shows probable future development of Slovenia's population. In addition, the booklet brings the results of the low and high variants of this projection that were prepared by the Statistical Office of the Republic of Slovenia (SORS) to offer the users of our data the possibility of insight into various possible "scenarios" of Slovenia's population development.

Preparation of projections

For preparing projections of expenditure related to population ageing, following a mandate from ECOFIN at the end of March 2008 Eurostat, the Statistical Office of the European Communities, prepared the population projection, convergence scenario, for the 2008-2060 period for all 27 EU Member States, Norway and Switzerland. The projection was named EUROPOP2008, and its results were published in spring 2008 on Eurostat's website (<http://epp.eurostat.ec.europa.eu/portal/page/portal/population/data/database>). Since then the data have been used as a mandatory basis for calculating projections of public expenditure in EU Member States.

EU Member States can prepare their own population projections (variants that take into account several hypotheses or a combination of individual hypotheses regarding fertility, mortality and migration) but they must take as the basis for official calculation of projections of public expenditure the results of the EUROPOP2008 population projection. Slovenia took over the Eurostat EUROPOP2008 population projection for Slovenia as its official population projection and the baseline variant. **In addition, the Statistical Office of the Republic of Slovenia calculated (for the policy makers and other users) other variants of population projections, including the so-called low and high variants.** On the basis of various variants of population projections it is possible to prepare various other projections, such as projections of public expenditure in Slovenia, which in discussions provide a wider view of the possible consequences of certain developments in our country.

Presentation of future demographic trends in Slovenia by 2060

The booklet presents the results of population projections - future demographic trends in Slovenia by 2060. The projections are based on the population of Slovenia at the beginning of 2008 and take into account the assumptions about future demographic changes as can be currently foreseen. Assumptions are briefly presented in the first part of the booklet; variants of projections (low, baseline, high) show the different possible paths of development of future demographic trends. The second part presents the results: the (likely) size of the future population and its age-sex structure in Slovenia by 2060.

I would like to thank everybody who contributed to the preparation and publication of these data.

Mag. Irena Križman, M.Sc.

PURPOSE OF POPULATION PROJECTIONS

Projections and forecasts of the future development of population and its components

Even the most effective way of collecting and processing statistical data provides only information relating to the past. Users of these data want - especially now during the rapid development in a number of areas - information that could with confidence be used also for the future and its successful planning. Science has been intensively included in searching for connections between 'statistical' data that documented the development in the past and the future development and has developed a comprehensive methodology of foreseeing and forecasting the future.

Demography plays an important role among the sciences that deal with foreseeing and forecasting the future. It deals with foreseeing and forecasting the future replacement of the population and its components, which is often called population projections. The term population projection means the calculation of the likely future number and structure of the population in certain areas based on assumptions about future developments in fertility, mortality and migration. Their purpose is to foresee as best as possible the future changes in the population and its structure.

Usually we distinguish between projections and prognoses. The former are the result of various hypothetical assumptions, while the latter contain the elements of forecasts.

Despite the fact that projections describe only a possible future development of the number and structure of the population, the preparation of good population projections is professionally and technically a very challenging task. Population projections are not restricted only to the evaluation of the results we obtained. Most of the time is spent preparing and organizing the relevant data.

For making projections the following is needed:

1. (Re)acquisition and organization of input data or basic data for calculating the projections
2. Analysis of trends and forming the hypotheses (assumptions about future demographic "behaviour"):
 - high quality, harmonised and relevant statistics, which are the basis for the analysis of demographic developments
 - good knowledge of the development in the area for which projections are made as well as wider
 - some bravery resulting from being experts in demography
 - appropriate software (each "step" requires specific hardware and software)
3. Conversion of data and hypotheses for entry into the selected software package
4. Calculation of projections
5. Analysis and presentation of final results

Variants of population projections

In order to maximize the coverage and foresee the future (un)foreseeable demographic trends in the country, it is usually necessary to prepare three variants of projections (low, baseline and high), which should cover the most likely full range of future population development. Although the demographic development can reach outside the high and low

PURPOSE OF POPULATION PROJECTIONS

boundaries, it has been generally shown that the baseline variant usually provides a fairly good foreseeing of future population growth, at least for the next 20 to 25 years.

Preparation of the assumptions

In preparing the assumptions we take into account a normal population development in the future, so that usually the possibility of catastrophic events, wars, epidemics is not considered. The assumptions that were taken into account in preparing national projections needed to be re-evaluated by Eurostat. The anticipated movement of total fertility, life expectancy at birth and net migration nevertheless provides only conditional future movements in fertility, mortality and migration as all these indicators have in the background a specific distribution by sex and age, which also to some extent affects the results.

As a rule, the hypotheses are prepared in two steps:

1. First, the future trends must be expressed by corresponding aggregate indicators (total fertility, life expectancy at birth, net migration)
2. Then the corresponding age distribution by individual periods and the number of variants are calculated.

Fertility

The future total fertility is assumed on the basis of past trends and the current fertility rate and age-sex structure of the population. All this is affected by a wide range of different factors, from socio-economic to historical, cultural and political.

Mortality

The estimated life expectancy at birth by sex is based on the working model of prolonging life. It is based on the principle that the older the age group, the prolonging of life is growing more slowly (taking into account life expectancy at birth).

Migration

Without a doubt "the most difficult task" was determining the hypotheses for the population projection, since most debates about the past and future demographic trends were dedicated to the issue of international migration. The huge increase in immigrants at the end of the 1980s and in the early 1990s surprised virtually everyone. Today, international migration is a widespread phenomenon and is a result of increasingly unpredictable political, economic and social circumstances. The age and sex structures of migrants are calculated from empirical data.

Software used

In calculating the published variants of population projections for Slovenia in the 2008–2060 period LIPRO 4.0 software (for more about the basic methodological explanations on this software see the chapter on sources and literature) was used, which is used for making demographic projections also by Eurostat.

Official projections of Slovenia's population

Because of the abovestated, the production of population projections is usually one of the tasks of national statistical institutes.

The contents of the projections may be different, but the basis is always the population projection by age and sex. Various human activities (work, education, entertainment, giving birth, etc.) and needs (housing, food, transportation, health care, etc.) differ the most by age and sex.

PURPOSE OF POPULATION PROJECTIONS

In Slovenia population projections by age and sex used to be prepared by various institutes (focusing on the economy, social issues, employment, education, etc.), mainly only for their specific needs. Therefore, the results of these projections were not mutually comparable and also not available to all who wished to use them. Those that needed population projections by sex and age for preparing their “derivative” projections have always found themselves in a very unfavourable position. In order to avoid the mentioned problems in the future, by publishing publication projections by age and sex the Statistical Office of Slovenia wanted to offer to the general public the possibility of using a single basis for future planning in various areas of life and work.

The Statistical Office of the Republic of Slovenia included making the population projections for Slovenia in its program in 1984 and published the projections in these years:

In **1990** SORS prepared and published for the first time **Population Projections for the Socialist Republic of Slovenia 1986–2006**.

In **1995** SORS published **projections of population of Slovenia for the 1995–2020 period**, which were prepared in 1993 in cooperation with the Statistical Office of the European Communities, Eurostat (Mr Harri Crujsen), in the context of the regional PHARE program. Eurostat provided technical support for implementing the tasks in the form of a specific software package MUDEA, which had been used by Eurostat before for preparing projections for EU Member States and EFTA countries.

In **2005** SORS published **Eurostat's population projections for Slovenia, 2004–2050**.

Eurostat was responsible for the preparation of population projections for old EU Member States (EU-15), new Member States and candidate countries. Accession of new EU Member States and particularly in recent years detected and in the future expected increase in the importance of the problem of population ageing in Europe only accelerated this task. Eurostat used its own data sources and completed the missing ones with the help of individual countries, and in cooperation with the Netherlands Interdisciplinary Demographic Institute (NIIDI) prepared a series of population projections for the 2004–2050 period, which was named EUROPOP2004. Eurostat made these population projections for the 2004–2050 period in several variants, for all EU Member States and candidate countries, and on 8 April 2005 published them on its website.

The projections were produced by the “trend” method, which meant that the design of assumptions about future movements in fertility, mortality and migration was based on their movements in the past. In preparing the assumptions about future developments in fertility, mortality and migration in each EU Member State and candidate country all the countries for which projections were made were involved.

For Slovenia, the proposal of the mentioned assumptions was developed by members of the working group on population projections for Slovenia at SORS. According to the results of Eurostat's projections, the population in the European Union should increase by 2025 and then decrease. The largest decline in population number was expected in countries that had become members of the European Union last.

The data of the baseline variant of Eurostat's population projections for Slovenia were published by SORS in its SI-STAT database, in which users can create their own tables by selected criteria.

In **2008**, at the end of March, Eurostat prepared for EU Member States, Norway and Switzerland population projections for 2008–2060 according to the so-called convergence scenario. The convergence year, i.e. the year in which (theoretically) the greatest

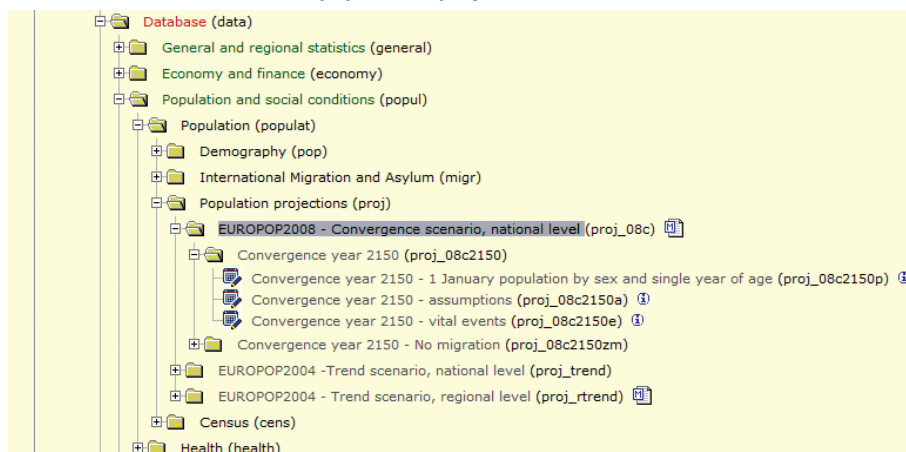

PURPOSE OF POPULATION PROJECTIONS

similarity of development of a selected indicator would be achieved, is 2150. Eurostat prepared **Population projections 2008-2060, EUROPOP2008, convergence scenario**, following a mandate from ECOFIN (Economic and Financial Affairs Council, one of the nine bodies of the Council of the European Union, which is composed of economic and finance ministers of EU Member States) as the basis for calculating projections of public expenditure related to population ageing in the EU. Projections offer an insight into the possible future population development in individual EU Member States, taking into account socio-economic and cultural differences among EU Member States, which according to assumptions will gradually disappear. Since Eurostat does not expect that the same values for all countries will be achieved during the projection period (until 2060) but only in a much more “distant” year 2150, only a certain degree of convergence between countries will be reached regarding the assumptions about demographic projections.

These population projections, EUROPOP2008, are thus not a “replacement” of previous EUROPOP2004 projections, but were prepared for the purposes of the projections of public expenditure associated with population ageing. In the future, Eurostat is expected to prepare “new” population projections, which should again be based on the “trend” method and will thus be more comparable with the mentioned EUROPOP2004 projections.

In addition to the variant that takes into account future development of fertility, mortality and migration, a variant was produced according to natural increase, in which migrations are not taken into account. The results of the mentioned projections were published by Eurostat in its website database and by SORS in the First Release (for more see: References).

Chart 1: Eurostat database – population projections

Source: Eurostat, <http://epp.eurostat.ec.europa.eu/portal/page/portal/population/data/database> [13 April 2009]

PURPOSE OF POPULATION PROJECTIONS

For the situation as of 31 December 2008, SORS introduced a new definition of population, but in EUROPOP2008 population projections this change was not taken into account as the basis for calculating projections in this booklet was the situation as of 1 January 2008. For more about the new definition of population see http://www.stat.si/eng/novica_prikazi.aspx?id=1608 / 16 June 2009.

EUROPOP2008 projection variants

Eurostat's newest projection variant, EUROPOP2008, was in this publication named the baseline variant. Within EUROPOP2008 SORS also prepared the high and the low variants of these projections for Slovenia. The baseline variant of population projections assumes a gradual rise in the total fertility rate in the 2008-2060 period from 1.32 to 1.52, a gradual increase in life expectancy from 74.4 to 83.7 years for men and from 81.9 to 88.8 years for women, and a gradual decrease in net migration from 2,909 to 1,133 for men and from 2,954 to 1,121 for women. At the low and high variants that were prepared by SORS the following values of hypotheses were used:

Table 1: Life expectancy, total fertility rate and net migration, EUROPOP2008 population projection, low, baseline and high variants, Slovenia, 2060

Projection variant	Life expectancy (years)		Total fertility rate	Net migration (number)
	men	women		
Low	80.06	85.70	1.30	800
Baseline	83.71	88.80	1.52	2,254
High	87.36	91.90	1.90	5,300

Source: SORS, Working group on population projections for Slovenia

Data for those variants of **Eurostat's population projections for the 2008–2060 period (EUROPOP2008) for Slovenia, convergence scenario**, that take into account the future development of fertility, mortality and migration are – as the low and the high variants of these projections which were prepared by SORS – also published in the SI-STAT Database at http://www.stat.si/pxweb/Database/Dem_soc/Dem_soc.asp, which enables users to design their own tables according to selected criteria.

POPULATION PROJECTIONS AND EUROPOP2008

Population projections are methods for foreseeing and forecasting future development and structure of the population. Future population "growth" is namely determined by the natural and migration changes and can be positive or negative. Population development is a broader term, which determines complex quantity and quality changes that present an improvement of the population.

This broader term includes prognoses or forecasts and population perspectives. Population prognoses are the ones for which the author is convinced that they will come true and thus in a way stands behind them with his or her professional authority. Therefore, they are usually produced only in one variant. On the other hand, population perspectives are usually produced in several variants: for individual variants authors prepare different hypotheses on future development of "elements" of population reproduction, but do not declare which is more plausible. All that they indicate is that an individual variant will come true if the assumptions and hypotheses according to which an individual variant is calculated come true.

Eurostat's EUROPOP2008 population projection

Eurostat, the Statistical Office of the European Communities, prepared a population projection (with calculations: total, men, women) for the 2008–2060 period, convergence scenario.

Background

At the end of March 2008, Eurostat prepared for EU Member States, Norway and Switzerland population projections for 2008–2060 according to the convergence scenario. The EUROPOP2008 population projection 2008–2060, convergence scenario, was prepared by Eurostat following a mandate from ECOFIN as the basis for calculating projections of public expenditure related to population ageing in the EU.

Brief description

The convergence scenario of the EUROPOP2008 population projection (**EURO**pean **POP**ulation **P**rojections, base year 2008) contains the following statistical information on population projections:

- projected number of population on 1 January by sex and age,
- projected life events (births and deaths) and
- assumptions about total fertility rate, life expectancy at birth by sex, and international migration.

Data are valid for 27 EU Member States, Norway and Switzerland.

EUROPOP2008 population projection is not a forecast

The EUROPOP2008 population projection offers an insight into the possible future population development in individual countries, taking into account socio-economic and cultural differences among EU Member States, which according to assumptions will gradually disappear.

Methodology for preparing projections

The methodology has been developed based on the assumption that the socio-economic and cultural differences between the Member States of the European Union, Norway and Switzerland will fade out in the very long run (for example, in the next century). The methodology consists essentially of setting the values of the demographic indicators for the convergence year (e.g. 2150), i.e. the year in which the theoretical convergence would be achieved, and of appropriate interpolation from the starting value for each country

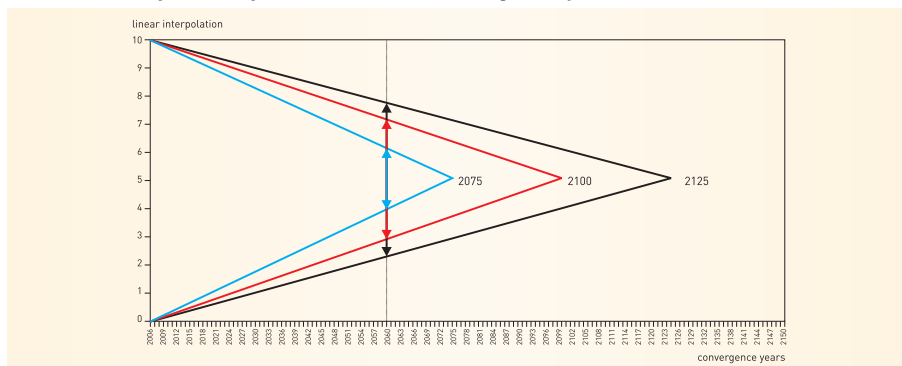

POPULATION PROJECTIONS AND EUROPOP2008

and each demographic component (fertility, mortality, migration). The national values for the target year (2060) are thus derived.

At the end of March 2008, Eurostat prepared for EU Member States, Norway and Switzerland the population projection for 2008–2060 according to the so-called convergence scenario. The convergence year, i.e. the year in which (theoretically) the greatest similarity of development of a selected indicator would be achieved, is 2150.

EUROPOP2008 population projection, convergence scenario, was prepared by Eurostat following a mandate from ECOFIN as the basis for calculating projections of public expenditure related to population ageing in the EU. EUROPOP2008 offers an insight into the possible future population development in individual countries, taking into account socio-economic and cultural differences among EU Member States, which according to assumptions will - in the long run - disappear: thus in the meantime differences between the values of selected demographic indicators will still be evident. The methodology consists essentially of setting the values of the demographic indicators for the convergence year (e.g. 2150), i.e. the year in which the theoretical convergence would be achieved, and of appropriately interpolating from the starting value for each country and each demographic component (fertility, mortality, migration). The national values for the target year (2060) are thus derived.

Chart 2: Example of impact of different convergence years

Source: Eurostat

Definitions of concepts used

- **Convergence year** is the year in which (theoretically) the greatest similarity of the development of a selected indicator will probably be achieved. In this case it is 2150.
- **Convergence values** are assumed values of indicators taken into account in convergence years.
- **Starting year** is the year in which extrapolation towards the convergence year starts. In this case it is 2008.
- **Starting values** are values at which the extrapolation towards the convergence values starts.
- **Target year** is the intermediate year taken into account as the final year of a projection. In this case it is 2060.
- **Target values** are values obtained by interpolation between the starting and target values in the target year.

POPULATION PROJECTIONS AND EUROPOP2008

In addition to the variant that takes into account future development of fertility, mortality and migration, another variant was produced according to natural increase, in which migrations are not taken into account (EUROPOP2008 projection variant »without migration«, see next chapter).

For fertility and mortality the following values of assumptions were taken into account for individual EU-27 Member States: total fertility, life expectancy for men and women, and migration.

Table 2: Total fertility rate, life expectancy at birth and migration, EUROPOP2008 population projection, baseline variant, EU-27 Member States, Norway and Switzerland, 2060

ASSUMPTIONS ABOUT POPULATION DEVELOPMENT OF SLOVENIA BY 2060

Assumptions about future fertility, life expectancy at birth and annual net migration in Slovenia by various variants of population projections

Projection variants

The newest Eurostat variant of population projections EUROPOP2008 was named the **baseline variant**, while SORS also prepared the high and low variants of these projections for Slovenia. The baseline variant of population projections assumes gradual rise of the total fertility rate in the 2008-2060 period from 1.32 to 1.52, a gradual increase in life expectancy from 74.4 to 83.7 years for men and from 81.9 to 88.8 years for women, and a gradual decrease in net migration from 2,909 to 1,133 for men and from 2,954 to 1,121 for women. Taking these assumptions into account, by 2060 the population of Slovenia should decrease by slightly less than a quarter of a million. The age structure is also expected to change significantly. The share of people aged 65+ should double (from 16.1% in 2008 to 33.4% in 2060), while the share of people aged 15–64 should decrease substantially. According to the baseline variant the "old age dependency ratio" should rise by more than 2.7-times (from 25.0 in 2008 to 68.2 in 2060). So taking into account the mentioned assumptions about fertility, mortality and migration, there should be a slightly higher population ageing than anticipated by the baseline variant (by 2060 the value of the old age dependency ratio is supposed to increase to 64.4) in which the old age dependency ratio should increase to 60.3.

According to the **baseline variant** of EUROPOP2008 the number of population in Slovenia should continue to increase by 2019 when it should start to decline. Thus from the present number of 2.02 million, by 2019 the population is expected to increase to almost 2.06 million and then slowly but steadily decline to 1.76 million in 2060. Such development will be the result of constant increase in life expectancy at birth, a modest increase in fertility and a relatively modest net migration.

According to the **high variant** (which assumes that the total fertility rate will increase from 1.32 in 2008 to 1.90 in 2060, that life expectancy at birth will increase from 74.7 to 87.4 for men and from 81.9 to 91.9 for women and that annual net migration will only slightly decline from 5,863 to 5,330) there should be 625,000 more people in 2060 than according to the baseline variant and especially in the beginning of the projection the age structure should change less than according to the baseline variant.

According to the **low variant** (which assumes that the total fertility rate will decrease from 1.32 in 2008 to 1.3 in 2060, that life expectancy at birth will increase from 74.7 to 80.1 for men and from 81.9 to 85.7 for women and that annual net migration will decline from 5,863 to 800) there should be 321,000 less people in 2060 than according to the baseline variant.

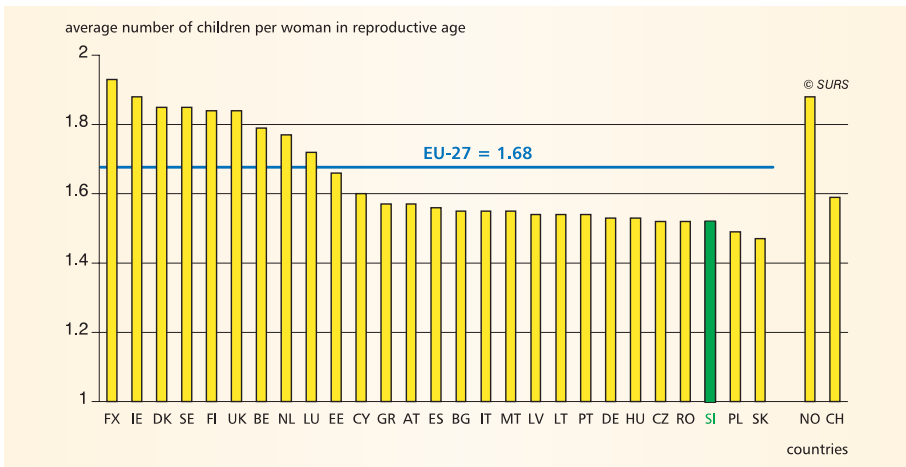

EUROPOP2008 projection variant »without migration«, which Eurostat prepared together with the baseline variant taking into account the same assumptions about fertility and mortality as in the baseline variant, actually shows the impact of migration on projection results: how much the process of population decline and ageing will be offset by net migration. The results of this projection variant show that without migration in

ASSUMPTIONS ABOUT POPULATION DEVELOPMENT IN SLOVENIA BY 2060

Slovenia in the future decades in 2060 the number of population in Slovenia would be 280,000 lower and the old age dependency ratio would be even higher (80.6 instead of 68.2). The impact of migration is both direct (the number of immigrants and emigrants) and indirect (the number of children born to people who immigrated to Slovenia). However, it needs to be mentioned that the “positive” impact of immigration of population ageing is gradually declining because the immigrants (who are usually young when they immigrate) are also gradually getting older.

FERTILITY

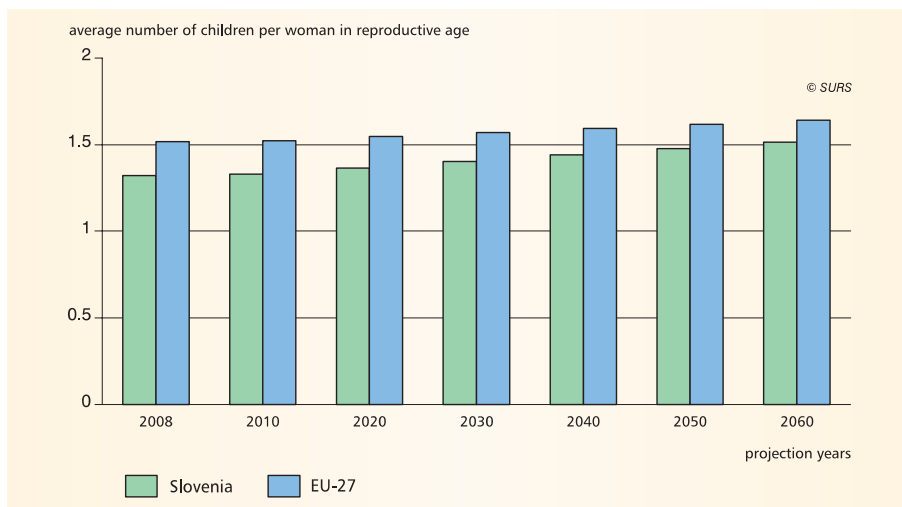

Chart 3: Total fertility rate, EUROPOP2008 population projection, baseline variant, EU-27 Member States, Norway and Switzerland, 2060

Source: Eurostat, EUROPOP2008, convergence scenario

- Slovenia is one of the countries with the lowest fertility rates in Europe. European comparisons show that the demographic situation is not favourable in most other countries, nevertheless in most EU-27 Member States total fertility rates are higher than in Slovenia.
- As regards fertility, there are great differences among EU Member States. Low fertility is characteristic of all countries that became Member States in 2004 and 2006. In these countries total fertility rates ranged between 1.24 in Slovakia and 1.47 in Cyprus. The highest total fertility rates are characteristic of countries in northern and western Europe, where the values ranged between 1.6 and 2.0. The highest rates in 2006 were recorded in France (2.0) and Ireland (1.90), and the lowest in Slovakia (1.24), Poland (1.27), and Slovenia, Lithuania and Romania (in each 1.31).

ASSUMPTIONS ABOUT POPULATION DEVELOPMENT IN SLOVENIA BY 2060, Fertility

Chart 4: Total fertility rate, EUROPOP2008 population projection, baseline variant, Slovenia and EU-27, selected years (2008, 2010, 2020, 2030, 2040, 2050 and 2060)

Source: Eurostat, EUROPOP2008, convergence scenario

- Analyses of demographic trends in Slovenia in the past fifty years show that the so-called “demographic bottom” was reached in 2003. After 2003, and especially in 2007, the data on demographic trends in Slovenia were slightly more favourable, even though it is difficult to say that they forecast a more favourable population development in the future. In 2007, 19,823 children were born, which is the highest number in the past 15 years.
- After an intensive drop in fertility since the early 1980s, in the 1990s Slovenia was faced with very low fertility. Thirty years ago slightly fewer than 30,000 children were born each year, while in the beginning of the 21st century the number of live births was almost halved. The lowest number was recorded in 2003 when only 17,321 children were born and the total fertility rate was 1.20. For natural replacement of Slovenia’s population the total fertility rate should be 2.1 per woman. So Slovenia, as most other European countries, is faced with fertility below the replacement level. The total fertility rate, i.e. the average number of live-born children per woman in her reproductive age (at the present mortality rate and on the assumption that a woman will reach 49 years of age), for 2007 was 1.38.
- The analysis of the total fertility rate for Slovenia for the past 50 years shows that the population of Slovenia has been under the replacement level fertility since 1981.

ASSUMPTIONS ABOUT POPULATION DEVELOPMENT IN SLOVENIA BY 2060, Fertility

Chart 5: Mean age of mother at childbirth, EUROPOP2008 population projection, baseline variant, Slovenia and EU-27, selected years (2008, 2010, 2020, 2030, 2040, 2050 and 2060)

Source: Eurostat, EUROPOP2008, convergence scenario

- In Slovenia first-time mothers are on average more than 28 years old. The reason for the rising age is postponing births to later ages, which has not stopped by 2007. The mean age of mothers at first childbirth and at the birth of any child increased again by 0.2 of a year. In 2007, mothers were on average 29.9 years old while first-time mothers were on average 28.2 years old. Until now this has been the highest mean age of first-time mothers after World War II. In the last 30 years the mean age of first-time mothers increased by 5.3 years. In the 1960s mothers aged 28 on average gave birth to their second child.
- In the mid-1970s first-time mothers were on average less than 23 years old. Then their mean age started to rise because many women postponed births to later ages as a result of longer schooling and the higher employment rate of women.
- In 2007, the most fertile group of women were those aged 28, 29 and 30 years, as 1,000 women of that age gave birth on average to 119 children. In 2006, most children were also born by women of that age, but the values were lower. For example, fifteen years ago most women who gave birth were 23 years old.
- Compared to 2006, the fertility rate of women aged 34 increased the most. A third of women (3,108) who became first-time mothers in 2007 were over 30 years old.
- In the mid-1950 more than a third of all children were firstborn and almost a fifth of mothers gave birth to four or more children. From the mid-1970s on the ratio by order of birth has been about the same: a half of firstborns, over a third of secondborns, a tenth of thirdborns and about 3% of fourthborns or more.

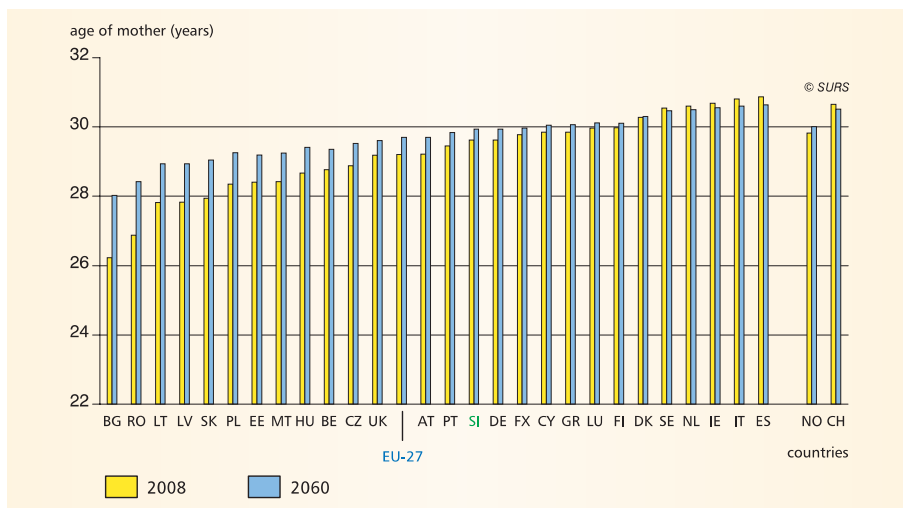

ASSUMPTIONS ABOUT POPULATION DEVELOPMENT IN SLOVENIA BY 2060, Fertility

MORTALITY

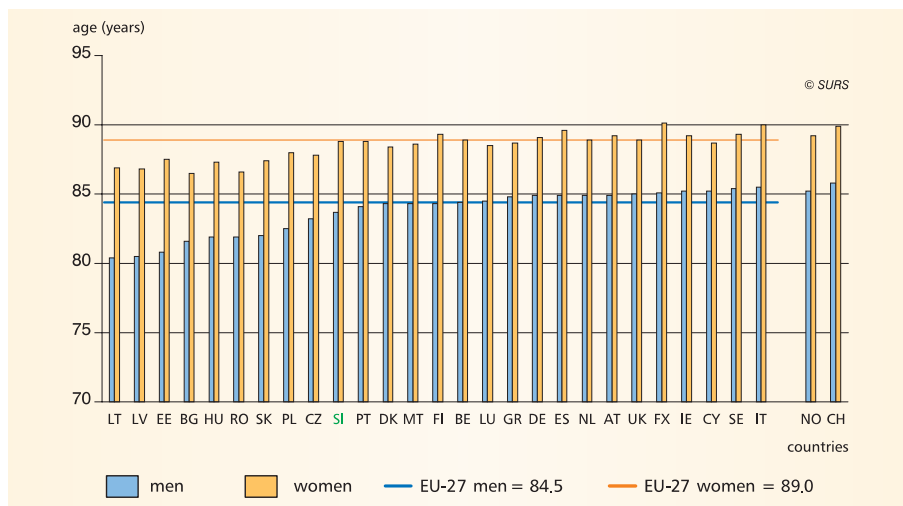

Chart 8: Life expectancy at birth by sex, Slovenia, 1960–1961 and 1986–1987 to 2006–2007

Source: SORS

- A decrease in mortality and an increase in life expectancy are characteristic of Slovenia.
- Compared to 2006, when it was the lowest after 1979, in 2007 the number of deaths in Slovenia returned to the level before 2006. In 2007, 18,584 people died (9,473 men and 9,111 women), or is 2.2% (404 people) more than in 2006. The crude death rate was 9.2 per 1,000 population or 0.1 higher than in 2006.
- The mean age at death for men in 2007 was 0.6 year higher and for women 0.1 year higher than the mean ages at death for men and women in 2006. In 2007 the mean age of men at death (69.1 years) was on average 9.1 years lower than the mean age of women at death (78.2 years). In the last three decades the mean age of men at death rose by a little bit more than 6 years (6.3) and of women by almost 8 years (7.8).
- Life expectancy at birth is the average number of years a newborn infant would be expected to live if mortality by age remained the same throughout his life. Life expectancy at birth is calculated from life tables.
- In Slovenia life expectancy at birth is getting longer; compared to 2005–2006, life expectancy for men rose by 0.2 year and for women by 0.4 year. In the last three decades, life expectancy rose by 8.2 years for men and by 7.7 years for women. A boy born in 2006–2007 can expect to live 75.0 years and a girl 82.3 years. Since the early 1960s life expectancy has increased by 8.9 years for boys and by 10.3 years for girls.

ASSUMPTIONS ABOUT POPULATION DEVELOPMENT IN SLOVENIA BY 2060, Mortality

Chart 9: Life expectancy at birth by sex, EUROPOP2008 population projection, baseline variant, EU-27 Member States, Norway and Switzerland, 2060

Source: Eurostat, EUROPOP2008, convergence scenario

■ Life expectancy at birth is increasing in all EU Member States, but with varying degrees of intensity. Life expectancy is the longest in southern (Spain, Greece, Cyprus) and northern (Sweden, Finland) countries and the shortest in eastern countries (Romania and Bulgaria) and Baltic States (Latvia, Lithuania, Estonia). According to Eurostat data, boys born in 2006 can expect to live at least 77 years in ten EU Member States and girls born in 2006 can expect to live at least 82 years in twelve EU Member States. In seven EU Member States life expectancy for men is less than 70 years and in nine EU Member States life expectancy for women is less than 80 years.

■ As regards EU Member States, in 2006 life expectancy was the longest for men in Sweden and Cyprus (78.8 years) and for women in Spain and France (84.4 years), and the shortest for men in Lithuania (65.3 years) and Latvia (65.4 years) and for women in Romania (76.2 years), and Bulgaria and Latvia (in each by 76.3 years).

ASSUMPTIONS ABOUT POPULATION DEVELOPMENT IN SLOVENIA BY 2060

MIGRATION

Population growth in EU-27 Member States by 2035 will be followed by a decline

Actual data of individual projections slightly differ due to different assumptions, but basically in recent years the story in Slovenia has always been the same: an ageing population, i.e. increasing population and the share of people over the age of 65, and in particular (according to more optimistic variants) the population above the age of 80 years, with a simultaneous decrease in the number of children and the deterioration of the ratio between the active and dependent population. According to more pessimistic or even medium assumptions, around 2030 or even earlier Slovenia will experience an accelerated decline in the total population.

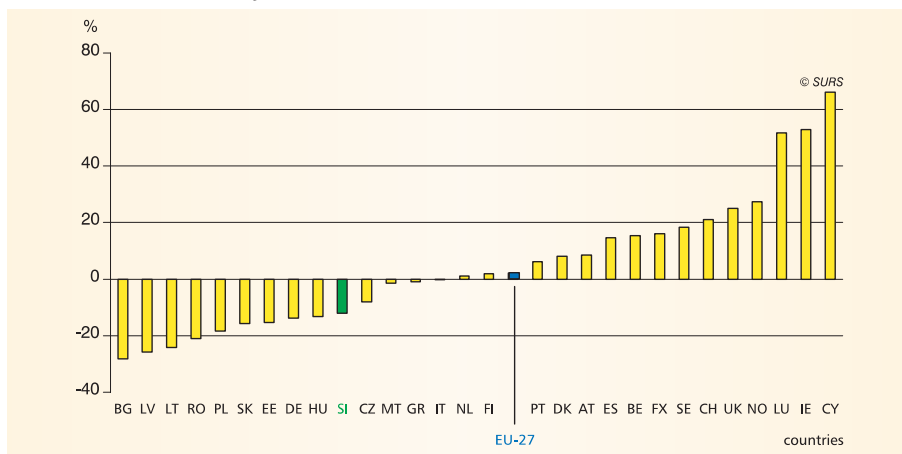

Table 3: »Demographic changes« in EU-27 Member States, EUROPOP2008 population projection, baseline variant, 2008–2060

	estimated population 1 Jan. 2008	cumulative births	cumulative deaths	Number (in 000) natural change 2008-2060	net migration	total change	projected population 1 Jan. 2060
EU-27	495,394.0	255,417.7	305,254.1	-49,836.3	59,030.9	9,194.6	504,588.6
SI	2,022.6	829.9	1,277.7	-447.8	193.2	-254.5	1,768.1

Source: Eurostat, EUROPOP2008, convergence scenario

- In EU the number of births will exceed the number of deaths from 2015 on. According to the EUROPOP2008 population projection, EU's population will increase by 2035 and then it will start to decline.
- Results show that in 2060 the population will shrink compared to 2008 in 14 EU Member States, including Slovenia.

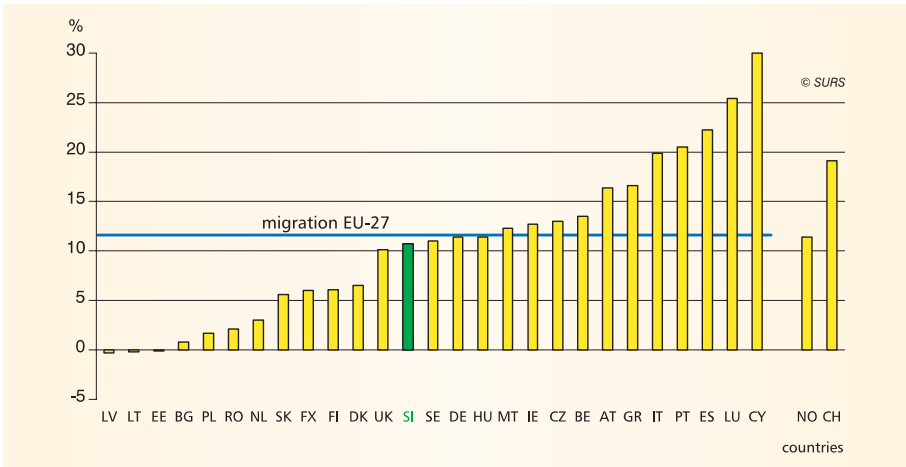

Chart 11: Changes in population shares, EUROPOP2008 population projection, EU-27 Member States, Norway and Switzerland, baseline variant, 2008–2060, (2008=100)

Source: Eurostat, EUROPOP2008, convergence scenario

ASSUMPTIONS ABOUT POPULATION DEVELOPMENT IN SLOVENIA BY 2060, Migration

Chart 12: Population growth due to migration, shares, EUROPOP2008 population projection, baseline variant, EU-27 Member States, Norway and Switzerland, 2008–2060

Source: Eurostat, EUROPOP2008, convergence scenario

- Migration will thus be the factor that determines the value of total population growth for an individual country.
- Population ageing is and will continue to be a characteristic of all EU-27 Member States, even though its dynamics and extent will vary among countries.
- Different speed of population ageing in the EU-27 is also shown by the values of the old age dependency ratio. Since the “age dependency ratio” shows the number of dependent population per 100 working age population in a given population, it is essential for illustrating the future demographic pressures of “dependent” population groups on the group of working age population. Age dependent people are children (aged up to 15 years) and the elderly (aged 65+). If both groups of dependent people are added, divided by the number of people aged 15-64 and multiplied by 100, the result is “total age dependency ratio”. However, if we want to express the dependency for each group, in the first case we get the “young age dependency ratio” and in the second case the “old age dependency ratio”.

DEMOGRAPHIC DEVELOPMENT OF SLOVENIA BY 2060

All variants point at distinct population ageing in Slovenia

Usually, the most important and especially in the economic analysis used variant of population projections is the baseline variant for which the authors of projections think that it is the most likely to be realized in the future. High and low variants of projections typically represent the lower and upper limits of likely future developments or changes in the number of people in a selected area. Sometimes the authors of the projections prepare the so-called “constant” variant and the zero migration variant or the variant according to natural increase. Such a variant was produced by Eurostat for all EU-27 Member States plus Norway and Switzerland within the mentioned EUROPOP2008 population projection and published in its database.

Although the population of Slovenia at the variation of individual assumptions, particularly in some age groups, is significantly different, all the results point to distinct population ageing in Slovenia.

It is obvious that today more than ever demographic changes, which have its origin in the development in the 19th and 20th centuries and still continue strong in the 21st century, are radically changing the world and the population, economic and social situation. The decline in fertility, enhanced by increasing life expectancy, led, and still leads, to unparalleled changes in the structure of all societies: an important historic turning point in the ratio of the shares of young and old population. Deep, pervasive and enduring consequences of population ageing, however, offer both great opportunities and new challenges for the society in Slovenia. The size, age-sex structure and regional distribution of our population in the forthcoming decades depend on the future levels of fertility, mortality and migration. All factors affecting the number and structure of the population are interdependent and at the same time strongly influenced by social and economic factors.

The population of Slovenia was - and still is - growing very slowly. The average annual growth rate of the population of Slovenia in the 1961-1971 period was 5.4, in the 1971-1981 period it was 9.0, in the 1981-1991 period 4.0 and between the 1991 and 2002 population censuses only 2.4. Such population development is also the result of the lower natural increase and net migration.

Demographic development in EU-27 Member States of course differs; nevertheless, most Member States forecast a positive turnaround in fertility for the years to come, while some Member States also forecast larger immigration. It is expected according to the EUROPOP2008 population projection that in these Member States by 2060 the number of people will be the same as it is today. (For more see the chapter Sources and literature.)

Due to low fertility, longer life expectancy at birth and constant inflow of immigrants by 2060 the number of people in EU-27 Member States will be similar to what it is today; however, it will be much older, which means that the ratio between working age population (15-64 years) and people aged 65+ will no longer be 4 to 1 but only 2 to 1. According to projections, this ratio should decrease the most in the 2015–2035 period, when the so-called “baby-boom” generation will retire.

DEMOGRAPHIC DEVELOPMENT OF SLOVENIA BY 2060

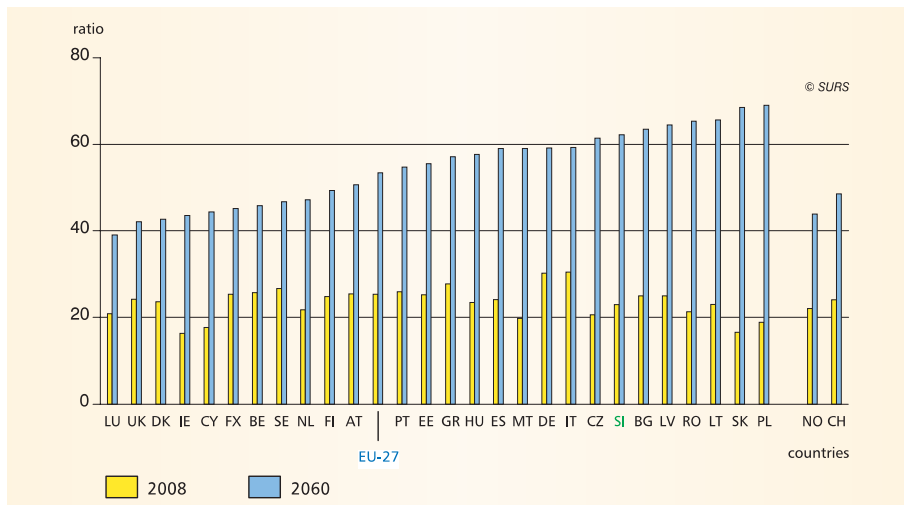

Chart 13: Population growth rate, EUROPOP2008 population projection, baseline variant, EU-27 and Slovenia, 2008–2060

Source: Eurostat, EUROPOP2008, convergence scenario

- The EUROPOP2008 population projection, convergence scenario, for the 2008–2060 period shows that the number of people in EU-27 Member States should increase from 495.4 million in 2008 to 520.7 million in 2035, and then gradually decrease, reaching 505.7 million in 2060.
- According to these projections (baseline variant), in the same period the number of people in Slovenia should first gradually increase from 2.02 million in 2008 to 2.06 million in 2019 and then gradually, but more rapidly than in the EU-27 as a whole, decrease to 1.77 million in 2060.

DEMOGRAPHIC DEVELOPMENT OF SLOVENIA BY 2060

AGE STRUCTURE OF THE POPULATION

Chart 14: Old age dependency ratio, EUROPOP2008 population projection, baseline variant, EU-27 Member States, Norway and Switzerland, 2008 and 2060

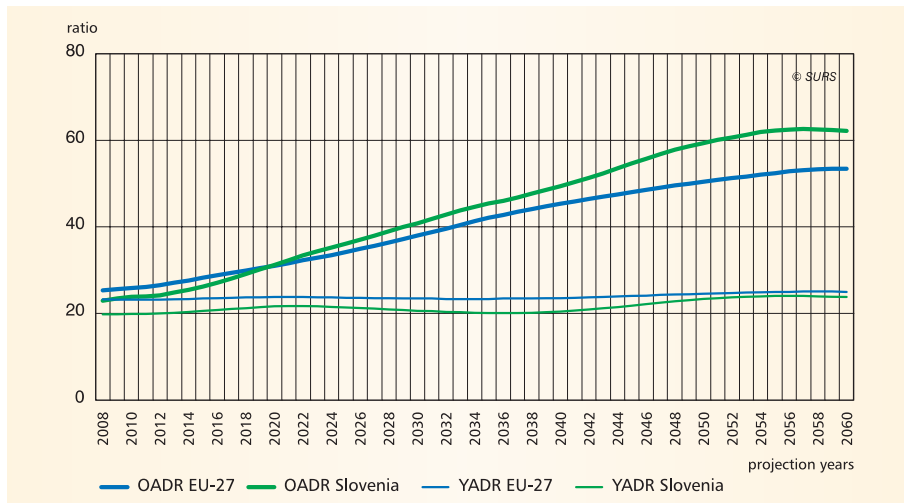

Source: Eurostat, EUROPOP2008, convergence scenario

- The main characteristic of the demographic future in Europe is population ageing. According to expectations, the population of EU-27 Member States will grow significantly older: the median age of the EU-27 population is expected to grow from 40.4 years in 2008 to 47.9 years in 2060.
- In the EU-27 the share of people aged 65+ in the total population should increase from 17.1% to 30.0%; the number of people aged 65+ should increase from 84.6 million in 2008 to 151.5 million in 2060.
- According to the baseline variant of the EUROPOP2008 population projection, in Slovenia the share of people aged 65+ in the total population should increase from 16.1% to 33.4%; the number of people aged 65+ should increase from 325,300 in 2008 to 589,900 in 2060.
- Similarly, in EU-27 the number of people aged 80+ should almost triple: from 21.8 million in 2008 to 61.4 million in 2060.
- According to the baseline variant of the EUROPOP2008 population projection, in Slovenia the share of people aged 80+ in the total population should increase from 3.5% to 14.1% or from 71,200 to 249,500.

DEMOGRAPHIC DEVELOPMENT OF SLOVENIA BY 2060

AGE DEPENDENCY RATIOS

Chart 15: Old age dependency ratio and young age dependency ratio, EUROPOP2008 population projection, baseline variant, EU-27 and Slovenia, selected years (2008, 2010, 2020, 2030, 2040, 2050 and 2060)

Source: Eurostat, EUROPOP2008, convergence scenario

- In the EU-27 the value of the “young age dependency ratio” is expected to increase moderately from 23.3% to 25.0% in 2060, while the “old age dependency ratio” is expected to increase sharply from 25.4% to 53.5% in 2060.
- For Slovenia the current values of these two ratios are expected to increase even more until 2060: the “young age dependency ratio” from 19.8% to 23.8% and the “old age dependency ratio” from 23.0% to 62.2%.
- Whereas in the EU-27 there were four working age people (15-64) per every person aged 65+ in 2008, it is expected that in 2060 there will be only two or even only one. In Slovenia there were 4.3 working age people per every person aged 65+ in 2008 and by 2060 it is expected that the ratio will be 1.6 to 1.

DEMOGRAPHIC DEVELOPMENT OF SLOVENIA BY 2060, Age dependency ratios

Chart 16: Old age dependency ratio, EUROPOP2008 population projection, baseline variant, EU-27 Member States, Norway and Switzerland, difference between 2008 and 2060

Source: Eurostat, EUROPOP2008, convergence scenario

- Although in 2060 the population of the EU-27 will probably be 2.1% higher than in 2008, there will be considerable differences between Member States. Fourteen Member States are expected to have a lower population than in 2008. In some of them - Bulgaria, Latvia, Lithuania, Romania, Poland, Estonia and Hungary - the population is expected to decrease throughout the 2008-2060 period.
- In some countries, including Slovenia, the population is expected to continue to rise for some time and then start to decline.
- Other EU-27 Member States and Norway and Switzerland will likely have more people in 2060 than in 2008, which is especially true for Cyprus, Ireland, Luxembourg, Norway, the United Kingdom, Switzerland, Sweden, Metropolitan France, Belgium and Denmark, where the population is projected to be constantly increasing.

Source: Eurostat, EUROPOP2008, convergence scenario and SORS

■ The main message of the EUROPOP2008 population projection for Slovenia is that according to expectations in the 2008–2060 period the share of people aged 60+ will double, while the share of people aged 80+ will increase by almost four times. Even greater changes are expected in the age groups 65+ and 85+.

■ Of course, this will cause the share of people aged 15–64 to decrease.

DEMOGRAPHIC DEVELOPMENT OF SLOVENIA BY 2060

AGE STRUCTURE, EU-27 and Slovenia

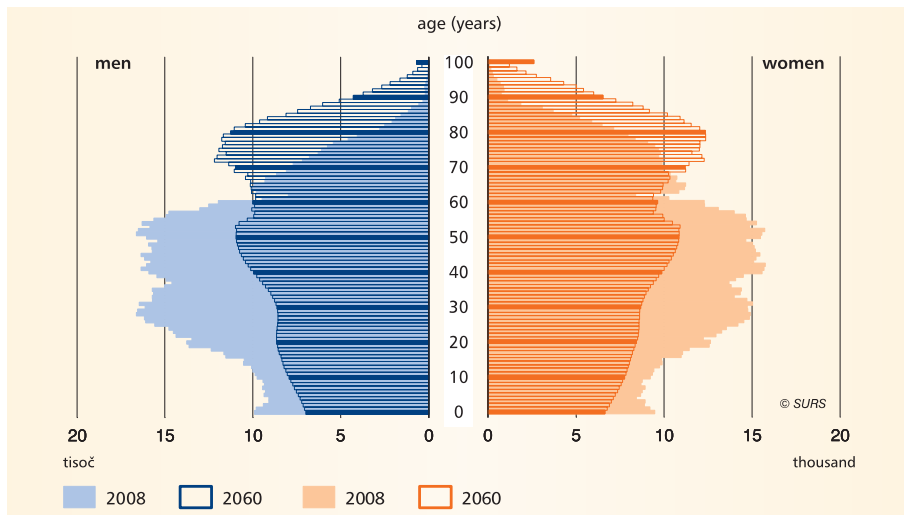

Chart 36: Age structure by sex, EUROPOP2008 population projection, baseline variant, EU-27, 2008 and 2060

Source: Eurostat, EUROPOP2008, convergence scenario

- The age structure of the population reflects the relationship between age classes by sex. The age and sex structures of the population in a specific year are shown by age pyramids. The population pyramid shows the distribution of the population by sex and age – each line corresponds to the share of people of a specific age, by sex, in the total population. This chart shows that in the EU-27 population ageing continues.
- The 2008 population pyramid for the EU-27 looked like a rhomboid as a result of the numerous »baby boom« generation (born in the 1960s). In the future decades the ageing of a large number of people born in the 1960s will most certainly increase the number of older people (top part of the pyramid) in the EU-27; the middle part of the pyramid (working age population) and the base of the pyramid (people aged 0-14) will by 2060 most certainly gradually become narrower.
- Population ageing is a general process in the EU-27 since according to expectations by 2060 the population will probably age in all Member States, Norway and Switzerland.
- The share of people aged 65+ should gradually increase in all countries. Only in six countries the increase will be less than 10 percentage points.
- The share of people aged 80+ is also expected to increase in all countries, both in relative and absolute terms.

DEMOGRAPHIC DEVELOPMENT OF SLOVENIA BY 2060, Age structure

Chart 37: Age structure by sex, EUROPOP2008 population projection, baseline variant, Slovenia, 2008 and 2060

Source: Eurostat, EUROPOP2008, convergence scenario

- Slovenia too will not be able to avoid population ageing. The decrease in the number of births and the slowdown in mortality will cause a change in the age structure. At the end of June 2008 the mean age of people in Slovenia was already 41.1 years.
- The future age structure of Slovenia's population of course reflects in the present.
- Thus according to expectations the number of people of retirement age will increase strongly and the number of young people will decrease. In the second half of the 21st century the shares of people aged 0-14 and 15-59 are expected to decrease by 1.1 and 16.7 percentage points respectively, while the shares of people aged 60+ and 80+ are expected to increase by 17.8 and 10.6 percentage points respectively.

AGE DEPENDENCY RATIOS (old, young, by the baseline variant)

Chart 42: Old age dependency ratio, EUROPOP2008 population projection, baseline variant, EU-27 Member States, Norway and Switzerland, 2008 and changes in the 2008–2060 period

Source: Eurostat, EUROPOP2008, convergence scenario

- Population ageing usually means increase in the number and share of older people, especially very old people, with a simultaneous decrease in the number of children and deterioration in the ratio between working age population and old age dependent population (65+). According to UN forecasts such development will continue worldwide. The population of developed countries is mostly already old and in many developing countries the ratios between the number of young, of working age and of old people are rapidly changing in favour of the old.
- According to Eurostat's EUROPOP2008 population projections, population ageing will remain intense; the number of people aged 65+ is expected to increase from 17.1% in 2008 to 30.0% in 2060 and the share of people aged 80+ from 4.4% in 2008 to 12.1% in 2060.
- In Europe the age limit dividing the population into the younger and the older halves was 31 years in 1950 and 38 years in 2005. In 2060 it is expected to be over 48 years. Such a trend is to a large extent the result of longer life expectancy and lower fertility.
- Demographic trends for Slovenia also show increase in the number of older people. At the end of 1995 Slovenia had 249,046 people aged 65+ and their share in total population was 12.5%. In 2008 people aged 65+ represented almost a fifth of total population and it is expected that in 2060 the share will be 35%.

DEMOGRAPHIC DEVELOPMENT OF SLOVENIA BY 2060, Age dependency ratio

■ The »age dependency ratio«, which shows the number of dependent people per 100 working age population, is of key importance for expressing the future demographic “pressure” on the economy. Age dependent people are children under 15 and people over 65 years. If both groups of dependent people are added, divided by the number of people aged 15-64 and multiplied by 100, the result is “total age dependency ratio”. However, if we want to express the dependency for each group, in the first case we get the “young age dependency ratio” and in the second case the “old age dependency ratio”.

DEMOGRAPHIC DEVELOPMENT OF SLOVENIA BY 2060, Age dependency ratio

Chart 43: Young age dependency ratio, EUROPOP2008 population projection, baseline variant, EU-27 Member States, 2008 and changes in the 2008–2060 period

Source: Eurostat, EUROPOP2008, convergence scenario

- Age dependency indicators, which are used to show the ratio between working age population and dependent people, i.e. indicating the support offered by the working age population (15–64) to the young (aged 0–14) and old (aged 65+) people. According to projections, in 2060 the number of working age population in the EU-27 should be almost 50 million smaller than in 2008, while the number of people aged 65+ is expected to increase by almost 67 million. As a result, in 2060 the value of the old age dependency ratio in the EU-27 will be more than twice the value in 2008, i.e. it will increase by 28.1 percentage points.
- The number of working age population is expected to decrease in almost two thirds of EU-27 Member States. The old age dependency ratio in 2060 is expected to differ by almost 30 percentage points among Member States: the largest differences are expected in Poland, Slovakia and Romania. In 2008, on the other hand, the difference among the old age dependency ratios in EU-27 Member States amounted to 14 percentage points – in Slovenia the difference in 2060 should be 39 percentage points, while in 2008 it was 23 percentage points.
- In 2008 the value of the old age dependency ratio in new EU-27 Member States was relatively low, i.e. lower than in the EU-27. Except in Cyprus, by 2060 the value of this indicator should increase in all new EU-27 Member States and be above the EU-27 level of 28.1 percentage points. In these countries the values should be the highest among all EU-27 Member States.

DEMOGRAPHIC DEVELOPMENT OF SLOVENIA BY 2060, Age dependency ratio

- As regards the young age dependency ratio, it is expected that it will follow the old age dependency ratio. It is not likely that the values will be significantly lower since the share of working age population will also decrease.
- The greatest increase is expected in Slovenia (4.0 percentage points), Sweden and Estonia, and the greatest fall in Slovakia (-0.7 percentage points). As a result, the age dependency ratio will increase.

POPULATION (0–14 years and 65+)

DEMOGRAPHIC DEVELOPMENT OF SLOVENIA BY 2060

AGEING INDEX

Chart 45: Ageing index, Slovenia, 1989–2008

Source: SORS

- Irrespective of the different values of assumptions regarding fertility, mortality and migration in various population variants for Slovenia, all of them point to a general direction of population ageing, which is mostly the result of the fertility in the past.
- The number of old population in the future will to a large extent be influenced by mortality patterns. Because we expect longer life expectancy, the number of old people is expected to increase significantly.
- The working age population (people aged 15 to 64) is expected to continue its slow growth (mostly due to immigration) and then to start to decline.

DEFINITIONS¹ OF SOME CONCEPTS USED

Gross reproduction rate for a given calendar year is the average number of live-born girls which a generation of women in their reproductive age (15–49) would give birth to if their age-specific fertility rates remained equal to those in the observed year. It is calculated by multiplying all values of age-specific fertility rates in the calendar year by the number of living according to mortality tables for age groups of women aged 15–49 and adding them. The gross fertility rate is thus slightly lower than the total fertility rate.

Total fertility rate is the average number of live-born children per woman in her reproductive age (15–49). For the calendar year it means the average number of children borne per woman in her reproductive age (15–49) if age-specific fertility rates remained the same as in the observed year. It is calculated by adding all values of age-specific fertility rates in the calendar year.

Ageing index is the ratio between the old population (aged 65 years and over) and the young population (aged 0–14 years), multiplied by 100. The lower the ageing index the more favourable the age structure of the population. A normal ageing index ranges between 40 and 50.

The sex ratio for children born in the calendar year is the ratio between the number of newborn boys and girls per 1,000 children multiplied by 1,000. Whereas the differences in fertility are very large among countries, the differences in the sex ratio are very small. In population projections the coefficient of 0.517 was used.

Young age dependency ratio (the burden of working age population with dependent young people) is the number of people aged 0–14 compared to the number of working age population (aged 15–64) in a country or a territorial unit.

Old age dependency ratio (the burden of working age population with dependent old people) is the number of people aged 65+ compared to the number of working age population (aged 15–64) in a country or a territorial unit.

Total age dependency ratio (the burden of working age population with dependent young and old people) is the number of people aged 0–14 and 65+ compared to the number of working age population (aged 15–64) in a country or a territorial unit.

International migration is spatial movement where previous or next residence of the migrant is abroad.

Natural increase is the difference between the number of live births and the number of deaths for a given area in the calendar year.

Natural increase per 1000 population is the ratio between the natural increase in the calendar year and the same midyear population for a given area, multiplied by 1000.

Net reproduction rate for a given calendar year is the average number of live-born girls which a generation of women in their reproductive age (15–49 years) would give birth to if their age-specific fertility and mortality rates remained equal to that in the observed year. It is calculated by multiplying the gross fertility rate by 0.483 to get the figure for girls. Normally 517 boys and 483 girls are born per 1,000 newborns.

¹ Definitions are taken over according to the methodology of Slovenian statistics.

DEFINITIONS OF SOME CONCEPTS USED

An emigrant is a person who leaves the settlement of former permanent residence with the intention to live permanently in another settlement.

A person emigrating abroad is a resident of Slovenia who emigrated from Slovenia.

A resident is a person with permanent, temporary or another legally determined residence in Slovenia. The definition of a resident may vary depending on the source.

Residents are all people who have their permanent residence in a settlement, meaning that they live there permanently, irrespective of whether they are temporarily absent at the time of the statistical observation.

Life expectancy is the average number of years to be lived by a person, aged exactly x years, if the mortality by age during his/her lifetime remains the same as the values of the life tables for the observed year.

An immigrant is a person who immigrated to a settlement with the intention to live there permanently.

An immigrant from abroad is a resident of Slovenia who immigrated from abroad and registered his/her residence in Slovenia.

Population projection – the expression denotes the calculation of the probable future number and structure of population in a certain area by various characteristics based on hypotheses of the future development of fertility, mortality and migration.

Migration is spatial movement of a migrant from a settlement in Slovenia to a settlement in some other country (when the observation unit is the Republic of Slovenia).

Net migration between municipalities is the difference between the number of immigrants from other municipalities and the number of emigrants to other municipalities of Slovenia in the calendar year.

Net international migration is the difference between the number of immigrants from abroad and the number of people emigrating abroad for a given area in the calendar year.

Migrant is a person who migrates.

Total increase is the sum of natural increase and net migration for a given area in the calendar year.

Total increase per 1000 population is the ratio between the total increase in the calendar year and the same midyear population for a given area, multiplied by 1000.

General fertility rate is the ratio between the number of live-born children in the calendar year and the same midyear population of women in reproductive age (15–49), multiplied by 1000.

Permanent residence is a settlement in which a person settled with the intention of living there permanently and confirmed that with the appropriate administrative procedure.

Death is permanent disappearance of all evidence of life of a person at any time after he/she was live-born.

Age is the period of time a person has lived from his/her birth to the moment of observation (census, survey) or until the observed event (marriage, birth of the first child, employment, death, etc.).

It is usually measured in years, but can also be measured in months, days or even hours. It is determined in two ways: by completed years of age and by the year of birth. The two breakdowns are the same only at the beginning (1 January) and the end (31 December) of each calendar year. If not specified, age is shown in completed years of age.

DEFINITIONS OF SOME CONCEPTS USED

Age-specific fertility rate is the number of live births to mothers in a given age group per 1,000 women in that age group in a given year.

Age-specific mortality rate is the number of deaths in a given age group per 1,000 population in that age group in a given year.

Number of deaths per 1,000 population is the number of deaths per 1,000 population in a given year.

A dead person is one whose evidence of life permanently disappeared any time after he/she was live-born.

A live-born is a child who immediately after birth showed signs of life (breathing, heart-beat, muscle twitch), even though only for a short period. The duration of pregnancy is not important.

Live births per 1,000 population is the number of live births per 1,000 population in a given year.

STATISTICAL SIGNS AND ABBREVIATIONS

0–14	population aged 0-14
0–19	population aged 0-19
15–64	population aged 15-64
65+	population aged 65 and over
75+	population aged 75 and over
80+	population aged 80 and over
85+	population aged 85 and over
100+	population aged 100 and over
