

# WEED VEGETATION OF THE NORTHERN PART OF LJUBLJANSKO POLJE

Urban ŠILC\*

## Abstract

Weed vegetation of northeren margins of Ljubljana was researched according to the standard Central-European phytosociological method. The following syntaxa were established: *Veronicetum trilobae-triphylliidi* Slavnić 1951 corr. Holzner 1973, *Alchemillo-Matricarietum* R. Tx. 1937, BC *Alchemilla arvensis-[Scleranthion annui]*, *Panico-Chenopodietum* R. Tx. 1937, *Echinochloo-Setarietum* Felföldy 1942 corr. Mucina 1993.

## Izvleček

Po standardni fitocenološki metodi smo raziskali plevelno vegetacijo severnega obroba Ljubljane. Ugotovili smo sintaksone: *Veronicetum trilobae-triphylliidi* Slavnić 1951 corr. Holzner 1973, *Alchemillo-Matricarietum* R. Tx. 1937, TZ *Alchemilla arvensis-[Scleranthion annui]*, *Panico-Chenopodietum* R. Tx. 1937, *Echinochloo-Setarietum* Felföldy 1942 corr. Mucina 1993.

**Key words:** weed vegetation, *Stellarietea mediae*, Slovenia

**Ključne besede:** plevelna vegetacija, *Stellarietea mediae*, Slovenija

## 1. INTRODUCTION

The weed and ruderal vegetation of Ljubljana, and above all of its northeastern margins, was studied by Zalokar (1937, 1939). In his manuscripts he newly described two, nowadays well-known associations (*Veronica hederifolia*-Ass., *Melilotus albus-Picris hieracioides*-Ass.). Although these descriptions are no longer valid, he is nevertheless considered as one of the pioneers of weed vegetation research. The research of weed vegetation was repeated in order to find out the changes in its composition in the last sixty years. The results are published in a separate article (Šilc & Čarni 2005). In this work the syntaxonomy of weed vegetation is presented.

## 2. THE STUDY AREA

Research in Ljubljansko polje was limited to the area of research conducted by Zalokar (1939). This is an area surrounded by the roads Medno-Ljubljana,

Ljubljana-Zadvor-Sostro, by the Ljubljanica and the Sava rivers up to the ford at Dolsko, and by the road Dolsko-Beričevo-St. Jakob-Črnuče-Tacen-Vikrče, where the borderline goes across the Sava river back to Medno.

The plain has a moderately wet continental climate, which means that the mean annual temperature in Ljubljana is 9.5 °C and the central parts receive between 1400 to 1600 mm of rainfall.

The soils on younger gravel terraces and morains are 20 to 30 cm deep rendzinas, which are rather fertile and therefore often used as fields (Perko & Orožen Adamič 1998).

Phytogeographically, Ljubljansko polje is classified into the pre-Alpine phytogeographical region (Wraber 1969).

The majority of surfaces were deforested. Among forest communities two associations occur – *Vaccinio myrtilli-Pinetum sylvaticae* and *Helleboro nigrae-Carpinetum*; the rest are meadows (habitat Central-European moderately dry grasslands) and fields.

### 3. METHODS

The vegetation was researched applying the standard Central-European method (Braun-Blanquet 1964, Westhoff & van der Maarel 1973). The phytosociological nomenclature is in accordance with Jarolímek et al. (1997), and the nomenclature of vascular plants follows Ehrendorfer et al. (1973), except for the species *Setaria pumila* (Poiret) Schulthes in Schultes & Schultes fil.

### 4. RESULTS AND DISCUSSION

*Stellarietea mediae* R. Tx., Lohmeyer et Preising in R. Tx. ex von Rochow 1951

*Violenea arvensis* Hüppe et Hofmeister ex Jarolímek et al. 1997

*Centaureetalia cyanii* R. Tx., Lohmeyer et Preising in R. Tx. ex von Rochow 1951

*Veronico-Euphorbion* Sissingh ex Passarge 1964

*Veronicetum trilobae-triphylli* Slavnić 1951 corr. Holzner 1973

*Atriplici-Chenopodietalia albi* R. Tx. (1937) Nordhagen 1940

*Scleranthion annui* (Kruseman et Vlieger 1939) Sissingh in Westhoff et al. 1946

*Alchemillo-Matricarietum* R. Tx. 1937  
BC *Alchemilla arvensis*-[*Scleranthion annui*]

*Spergulo-Oxalidion* Görs in Oberd. et al. 1946

*Panico-Chenopodietum* R. Tx. 1937

*Panico-Setarion* Sissingh in Westhoff et al. 1946

*Echinochloo-Setarietum* Felföldy 1942 corr. Mucina 1993

1. *Veronicetum trilobae-triphylli* Slavnić 1951 corr. Holzner 1973  
(Tab 1/1–15)

The spring stands with the species *Veronica hederifolia* are common and well developed. Some character and differential species determined by Jarolímek et al. (1997) (*Veronica triphyllum*, *Holosteum umbellatum*...) are missing, however. On account of the altered land management these species are rare, but the syntaxon is clearly defined also because of the development in the spring agroecophase. Seasonal dynamics is one of the most important factors influencing the floristic composition of weed stands (Lososová et al. 2004).

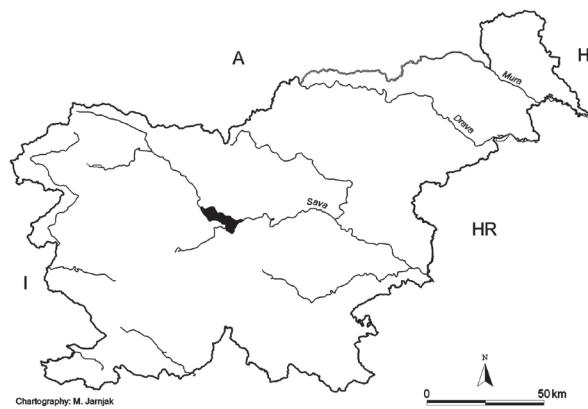

Figure 1: Research area.  
Slika 1: Raziskovano območje.

2. *Alchemillo-Matricarietum* R. Tx. 1937 & BC *Alchemilla arvensis*-[*Scleranthion annui*]

(Tab 1/24–29 & 16–23)

In the study area, the most characteristic cereal association in Slovenia is only rarely developed with a complete diagnostic combination of species, which is the result of the altered agrotechnical measures. Most of the cereal fields are weedless (on account of the thick canopy and herbicides), but also common are the stands where the character species *Matricaria chamomilla* is missing – these are classified as a basal community. Chamomile was rare also in the stands studied by Zalokar (1939), who determined *Aphanes arvensis* as the main character species.

The stands in the entire study area are classified into the subassociation *legousietosum* Holzner 1973, which is characteristic for the sites with a higher content of clayey particles, rich in nutrients and soil moisture.

3. *Panico-Chenopodietum* R. Tx. 1937  
(Tab 1/30–52)

This is a characteristic hoe-field association on wetter fields or in places where rainfall water is retained for a longer period of time. The character species *Chenopodium polyspermum* characterizes the syntaxon, as do also some more hygrophilous species. Similar to this association is the facies with the species *Equisetum arvense*, already described by Zalokar (1939), which is characterized by the species *Calystegia sepium* and *Sympythium officianale*, nowadays characterizing the alliance *Spergulo-Oxalidion*.

**4. *Echinochloo-Setarietum*** Felföldy 1942 corr. Mucina 1993 (Tab 1/53–58)

The soil on gravel is dry due to water permeability, which is the reason why a more thermophilous association *Echinochloo-Setarietum* developed there. However, the boundary of this association with *Polygono-Chenopodietum polyspermi* (Krippelová 1979, Šilc 2005) is blurred despite their classification into different alliances. The stands of the latter association are rarer.

## 5. APPENDIX

### Other species:

*Medicago sativa* 8: +; *Trifolium* sp. 8: +; *Gnaphalium uliginosum* 9: r; *Knautia arvensis* 12: +; *Erophila verna* 15: 1; *Poa pratensis* 16: +; *Brassica oleracea* 17: +; *Sherardia arvensis* 20: +; *Agrostis gigantea* 21: +; *Odontites vernus* 25: +; *Trifolium campestre* 27: +; *Valerianella rimosa* 27: +; *Bromus hordeaceus* 28: +; *Festuca pratensis* 28: 1; *Vicia* sp. 29: +; *Carex hirta* 31: 1; *Cirsium vulgare* 31: +; *Dactylis glomerata* 31: +; *Hypericum humifusum* 31: +; *Scrophularia nodosa* 31: 1; *Verbascum* sp. 31: +; *Commelinna communis* 34: +; *Centaurea jacea* 36: +; *Lathyrus pratensis* 36: +; *Hypericum perforatum* 37: +; *Acer pseudoplatanus* 41: +; *Mentha longifolia* 41: +; *Urtica dioica* 41: +; *Helianthus tuberosus* 42: +; *Salix alba* 42: +; *Polygonum mite* 42: 1; *Aegopodium podagraria* 47: +; *Galium mollugo* 47: +; *Picris hieracioides* 47: +; *Silene vulgaris* 47: +; *Galeopsis pubescens* 51: 1; *Lamium maculatum* 51: +; *Leucanthemum ircutianum* 51: +; *Tanacetum vulgare* 52: +; *Populus alba* 53: +.
