

PHYTOSOCIOLOGICAL DESCRIPTION OF *OSTRYTA CARPINIFOLIA* AND *FRAXINUS ORNUS* COMMUNITIES IN THE JULIAN ALPS AND IN THE NORTHERN PART OF THE DINARIC ALPS (NW AND W SLOVENIA, NE ITALY)

Igor DAKSKOBLER¹

Abstract

Based on comparisons between similar communities in northeastern Italy, southern Austria, central and southeastern Slovenia, and western Croatia, we classified black hornbeam and flowering ash phytocoenoses on steep rocky sites in the beech forest belt in northwestern and western Slovenia into the association *Fraxinio orni-Ostryetum* Aichinger 1933 and described its new subassociation -*phyteumatetosum columnae* in the foothills of the Julian Alps and in the northern part of the Dinaric Alps. Black hornbeam and flowering ash stands on steep shady slopes with a higher proportion of diagnostic species of beech and spruce forests are classified into the new association *Rhododendro hirsuti-Ostryetum* Franz ex Dakskobler, ass. nov. hoc loco, new subassociation -*mercurialietosum perennis* and the provisional variant var. *Hemerocallis lilioasphodelus* whose stands are floristically rather similar to the stands of the association *Hemerocallido-Ostryetum*.

Key words: phytosociology, synsystematics, *Fraxino orni-Ostryion*, *Fraxino orni-Ostryetum*, *Rhododendro hirsuti-Ostryetum*, Julian Alps, Trnovski gozd plateau, Slovenia, Italy.

Izvleček

Na podlagi primerjav s podobnimi združbami v severovzhodni Italiji, južni Avstriji, osrednji in jugovzhodni Sloveniji ter zahodni Hrvaški smo fitocoze črnega gabra in malega jesena na strmih skalnatih rastiščih v pasu bukovih gozdov v severozahodni in zahodni Sloveniji uvrstili v asociacijo *Fraxinio orni-Ostryetum* Aichinger 1933 in v prigorju Julijskih Alp in v severnem delu Dinarskega gorstva opisali njen novo subasociacijo -*phyteumatetosum columnae*. Sestoje črnega gabra in malega jesena na strmih osojnih pobočjih z večjim deležem diagnostičnih vrst bukovih in smrekovih gozdov uvrščamo v novo asociacijo *Rhododendro hirsuti-Ostryetum* Franz ex Dakskobler, ass. nov. hoc loco in v novo subasociacijo -*mercurialietosum perennis* ter v provizorno varianto var. *Hemerocallis lilioasphodelus*, katere sestoji so floristično precej podobni sestojem asociacije *Hemerocallido-Ostryetum*.

Ključne besede: fitocenologija, sinsistematička, *Fraxino orni-Ostryion*, *Fraxino orni-Ostryetum*, *Rhododendro hirsuti-Ostryetum*, Julijske Alpe, Trnovski gozd, Slovenija, Italija.

1. INTRODUCTION

The first phytosociological description of a hop hornbeam and flowering ash community in the Southeastern Alps was published by Aichinger (1933: 267–269), who named it association *Ostrya*

carpinifolia-Fraxinus ornus (*Ostryo-Fraxinetum ornii*). M. Wraber (1961) classified hop hornbeam and flowering ash stands in the sunny rocks above Lake Bohinj and under Studor into the association *Cytantho-Ostryetum*. Franz (2002) published a monograph on hop hornbeam and its commu-

¹ Institute of Biology, Scientific Research Centre of the Slovenian Academy of Sciences and Arts, Regional unit Tolmin, Brunov drevored 13, SI-5220 Tolmin, and Biotechnical Faculty of the University in Ljubljana, Department of Forestry and Renewable Forest Resources, Večna pot 83, SI-1000 Ljubljana; E-mail: igor.dakskobler@zrc-sazu.si

nities in Austria and northern Slovenia and determined, based on 360 relevés, the following hop hornbeam associations: *Potentillo caulescentis-Ostryetum*, *Fraxino orni-Ostryetum* Aichinger, *Sileno glareosae-Ostryetum* nom. prov. and *Rhododendro hirsuti-Ostryetum* nom. prov. Franz & Willner (2007a,b) lowered the rank of these associations and classified all of them into the association *Erico-Ostryetum* Horvat 1959. According to them, the name *Ostryo-Fraxinetum orni* Aichinger 1933, although older, is a synonym for Horvat's association, supposedly because it is a *nomen ambiguum* (Weber et al. 2000, Art. 36, p. 754). Horvat (1959) described the association *Erico-Ostryetum* based on nine relevés from western Croatia and its stands are now known on smaller areas in Gorski kotor, on Klek, in the Samobor and Žumberak Hills (Vukelić 2012: 257). In our opinion, Franz and Willner's proposal (2007a, b) is unfounded. However, based on eight relevés from northern Italy (provinces of Trentino and South Tyrol), Braun-Blanquet (1961) published a phytosociological table of a new association that he named *Orneto-Ostryetum*. He noted the differences between this and Horvat's association *Querco-Ostryetum carpinifolie*, but did not mention Aichinger's association *Ostryo-Fraxinetum orni*, although he listed his book as a reference. The names *Ostryo-Fraxinetum orni* Aichinger 1933 and *Orneto-Ostryetum* Braun-Blanquet 1961 are homonyms; Braun-Blanquet's later name is illegitimate (nom. illeg.) and should be rejected according to the Code of Phytosociological Nomenclature (Weber et al. 2000, Art. 31, p. 753). In his description, Braun-Blanquet (1961) did not refer to Aichinger, but used a name identical to his (*Orneto-Ostryetum* is identical to *Ostryo-Fraxinetum orni*) to describe a floristically very different community whose similarity with Aichinger's community, according to SØRENSEN (1948), is only around 27%. Aichinger's name is not, therefore, ambiguous and does not have to be rejected; this, however, applies to subsequent misuse of this name by other phytosociologists. In this paper we use the corrected name proposed by Franz (2002), *Fraxino orni-Ostryetum carpinifoliae*, because according to our findings, hop hornbeam serves as an edifier of this community.

In the period between 1986 and 2012, we made some 250 relevés of black hornbeam and flowering ash stands on very steep rocky sites in the beech forest belt in the Julian Alps and their foothills (Bohinj, Upper Soča Valley: Bovec and

Kobarid regions, the valleys of the Tolminka and Zadlaščica, the Bača Valley, the Cerkno region) and in the northern part of the Dinaric Alps (the Idrijca and Trebuša valleys, the northern edge of the Trnovski gozd plateau, the Idrija Hills) (Figure 1). A part of these relevés (195) has already been entered into the database and 109 have been processed and compared with similar communities in southern Austria, northeastern Italy, and northern Croatia. Our intention was to provide a comprehensive floristic description of the hop hornbeam and flowering ash community in the Julian Alps and their foothills, as the description of the association *Fraxino orni-Ostryetum* in Slovenia has so far been based mainly on Aichinger's table or on a very limited number of relevés that were made and published in Slovenia (Šilc & Čarni 2012: 157). Most of Franz's relevés (2002) were not published in analytical tables. Some of them were published individually in the text and some were incorporated in the synthetic table. Much better researched are hop hornbeam and flowering ash communities in the sub-Mediterranean part of Slovenia (Zupančič 1999). We also conducted a phytosociological analysis of their community in the transitional pre-Alpine-sub-Mediterranean part of Slovenia, in the Central Soča Valley, and classified it into the association *Seslerio albicans-Ostryetum* Lausi et al. 1982 corr. Poldini & Vidali 1995 (= *Mercuriali ovatae-Ostryetum carpinifoliae* Poldini 1982) – Dakskobler (2004). This association is classified into the alliance *Carpinion orientalis* Horvat 1958 and is therefore not the subject of comparisons in this paper.

2. METHODS

Hop hornbeam and flowering ash communities were studied applying the Central-European phytosociological method (Braun-Blanquet 1964). Relevés were entered into the FloVegSi database (Seliškar et al. 2003). Combined cover-abundance values were transformed into ordinal values 1–9 (van der Maarel 1979). Relevés were mutually compared through hierarchical classification and arranged into tables based on the results of the “(Unweighted) average linkage” – UPGMA method applying Wishart's similarity ratio. SYNTAX 2000 (Podani 2001) software package was used in these comparisons. The floristic composition of the hop hornbeam and flowering ash communities studied in western Slovenia was compared to the floristic composition of similar communities in neighbouring countries, also by means of hierarchical classification and with two ordination methods: principle coordinates analysis (PCoA, similarity ratio) and non-metric multidimensional scaling (NMDS) with Goodman-Kruskal's γ coefficient (Podani, ibid.). Geoelemental, ecological, and phytosociological designation of plant species follows the Flora alpina (Aeschimann et al. 2004a, b, c). Phytosociological groups (= groups of diagnostic species) were formed based on our own criteria, but with consideration of the Flora alpina. The nomenclature source for the names of vascular plants is Martinčič et al. (2007), Martinčič (2003, 2011) for the names of mosses, Suppan et al. (2000) for the names of lichens, Šilc & Čarni (2012) for the names of syntaxa, with the exception of the name of the class *Querco-Fagetea* Braun-Blanquet et Vlieger in Vlieger 1937, and Urbančič et al. (2005) for the names of soil types.

2.1 SHORT ECOLOGICAL DESCRIPTION OF THE STUDY AREA

Hop hornbeam and flowering ash stands were recorded on steep to very steep slopes (30° to 50°) at elevations ranging from 300 m to 1200 m, on all aspects. In the Soča Valley, individual hop hornbeam and flowering ash trees can occur even higher, at elevations of up to about 1500 m a.s.l.. The geological bedrocks on sample plots were dolomite, dolomite with chert, dolomite limestone, limestone, limestone with chert, limestone and marlstone, in places also talus. Soil types were lithosol and (or) rendzina. The climate in

the study area of the Julian Alps and the northern part of the Dinaric Alps is humid with mean average precipitation generally exceeding 2000 mm (B. Zupančič 1995, 1998); it is relatively warm, with the mean annual temperature around $6\text{ }^\circ\text{C}$ – $9\text{ }^\circ\text{C}$ (Cegnar 1998). The forest stands that were studied grow on special sites with a unique local climate. On sunny aspects, temperature oscillations between day and night are considerable, rainfall and snowfall flow into the valley, the snow cover soon disintegrates and melts. These sites are subject to drought, especially in the summer, while crumbling of the rock mass frequently occurs in the winter as a result of freezing and subsequent rapid warmings. All these specific factors render the sites less suitable for the growth of beech, which is a dominant tree species that occurs contiguously in this region, building its communities in the altitudinal belt of 200 m to 1600 m a.s.l.. The current physiognomy of hop hornbeam and flowering ash stands is largely the consequence of past management and practice. Their origin is partly secondary and they are a long-term degradation stage on potential beech sites from the association *Ostryo-Fagetum*. People frequently used to bring small ruminants, especially goats, to graze on the steep rocky slopes covered with low woods and this practice is still maintained in some parts of the Bovec and Kobarič regions. Despite relatively extreme sites that are difficult to access, the primary physiognomy of the hop hornbeam and flowering ash community in our Alps has been preserved only in the most inaccessible rock walls and screes. Here and on rockfall areas, hop hornbeam and flowering ash are the first pioneers (Dakskobler 2007).

3. RESULTS AND DISCUSSION

Based on hierarchical classification (Figure 2) we arranged 119 relevés into four tables (Tables 1–4). In order to obtain a relevant synsystematic classification we compared them to similar, already described communities in the neighbouring regions. We made a synthetic table (Table 5) into which we incorporated the studied four communities and the following syntaxa:

EOPC: *Erico-Ostryetum* Horvat 1959 *potentilleto-sum caulescentis* (Franz) Franz & Willner 2007 (Austria, northern Slovenia, Franz & Willner 2007b, Table 13, column 5)

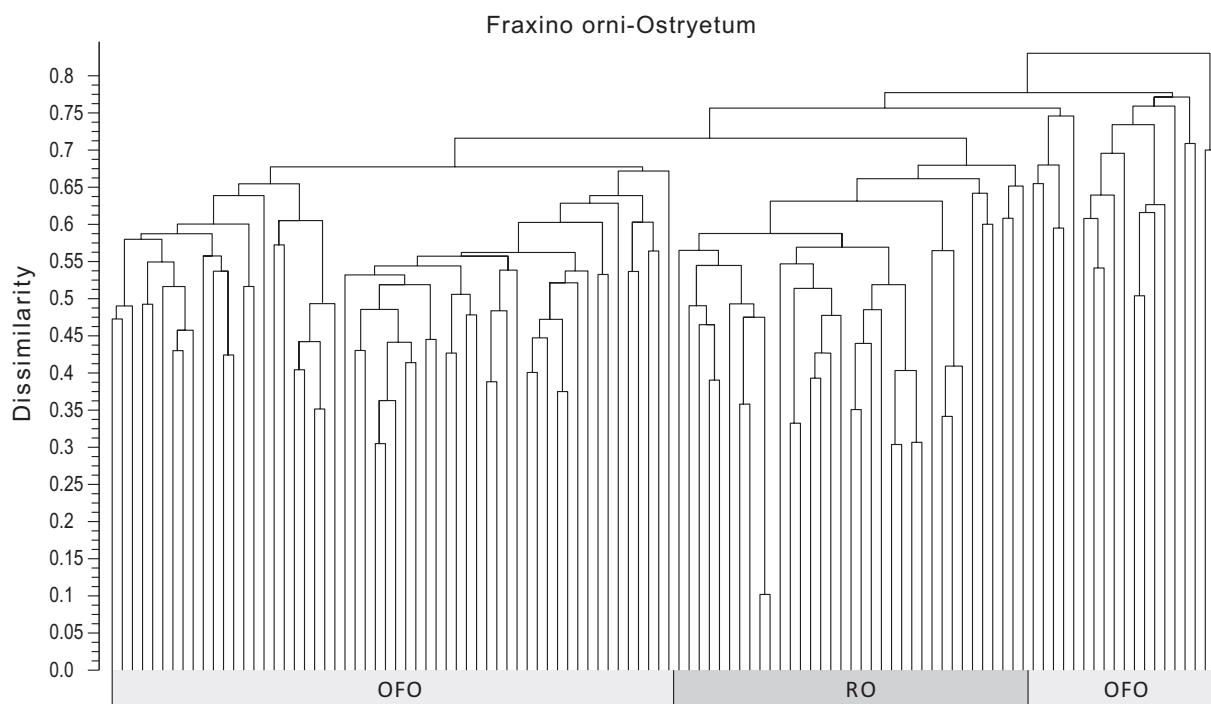

Figure 2: Dendrogram of relevés of hop hornbeam and flowering ash in (north)western Slovenia (UPGMA, similarity ratio); OFO *Fraxino orni-Ostryetum*, RO *Rhododendro hirsuti-Ostryetum*.

Slika 2: Dendrogram popisov sestojev črnega tabra in malega jesena v (severo)zahodni Sloveniji (UPGMA, similarity ratio); OFO *Fraxino orni-Ostryetum*, RO *Rhododendro hirsuti-Ostryetum*.

EOty: *Erico-Ostryetum* Horvat 1959 *typicum* Franz & Willner 2007 (Austria, Franz & Willner 2007b, Table 13, column 2)

Eosg: *Erico-Ostryetum* Horvat 1959 *silenetosum glareosae* (Franz) Franz & Willner 2007 (Austria, northern Slovenia, Franz & Willner 2007b, Table 13, column 2)

EOrh: *Erico-Ostryetum* Horvat 1959 *rhododendretosum hirsuti* (Franz) Franz & Willner 2007 (Austria, northern Slovenia, Franz & Willner 2007b, Table 13, column 3)

OFO-It *Ostryo carpinifoliae-Fraxinetum orni* Aichinger 1933 (northeastern Italy, Poldini & Vidal 1999, Table 1)

CyO-SI *Cytisanthro-Ostryetum* M. Wraber 1961 (Bohinj, M. Wraber 1961, phytosociological table, relevés 1 to 11 – subassociations -*typicum* and -*brometosum*; the species recorded only in the third subassociation, -*fagetosum*, were considered with minimum frequency 4 if they occurred in other compared communities)

CyO-HR *Cytisanthro-Ostryetum* M. Wraber 1961 (western Croatia, Samobor Hills, Šugar 1978, Table 1)

EO-HR *Erico-Ostryetum* Horvat 1959 (western Croatia, Horvat 1959, Table 2, column 12)

QO-HR *Querco-Ostryetum carpinifoliae* Horvat 1938 (Croatia, Horvat 1938, Table 1, relevés 1 to 11)

QO-SI *Querco-Ostryetum carpinifoliae* Horvat 1938 (Slovenia, Zupančič et al. 2009, Table 1, relevés 1 to 26).

This provided the basis for a table with 12 columns that we compared using hierarchical classification (Figure 3) and two ordination methods (Figures 4 and 5).

The result is similar (Figure 6) if the comparison includes Braun-Blanquet's association *Orneto-Ostryetum* from northern Italy (Braun-Blanquet 1961) and Aichinger's original description of the association *Ostryo-Fraxinetum orni* from the Karavanke Mts. (Aichinger 1933). While Aichinger's syntaxon groups with other forms of the association *Fraxino orni-Ostryetum*, Braun-Blanquet's syntaxon is different from all other compared syntaxa.

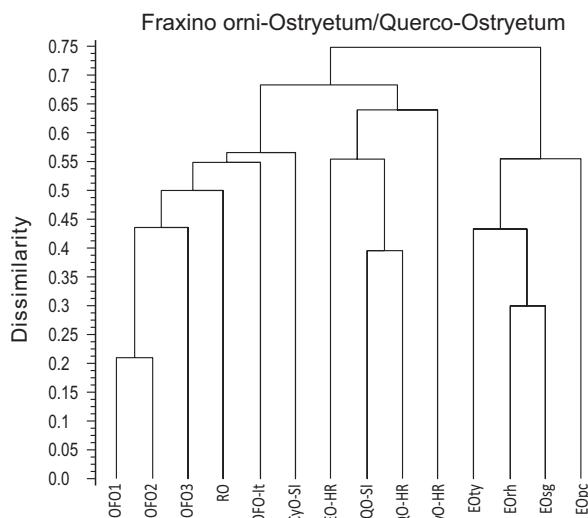

Figure 3: Dendrogram of stands of associations *Erico-Ostryetum*, *Cytisantho-Ostryetum*, *Rhodoendro hirsuti-Ostryetum*, *Fraxino orni-Ostryetum*, and *Querco-Ostryetum* (Slovenia, Italy, Austria, Croatia) – UPGMA, similarity ratio.

Slika 3: Dendrogram sestojev asocijacij *Erico-Ostryetum*, *Cytisano-Ostryetum*, *Rhododendro hirsuti-Ostryetum*, *Fraxino-orni-Ostryetum* in *Querco-Ostryetum* (Slovenija, Italija, Avstrija, Hrvaska) – UPGMA, similarity ratio.

- QO-SI *Querco-Ostryetum carpinifoliae* Horvat 1938 (central and southeastern Slovenia, Zupančič et al. 2009, Table 1, relevés 1 to 26)
- OFO-Aic *Ostryo-Fraxinetum orni* Aichinger 1933 (the Karavanke Mts, Aichinger 1933, Tab. 60)
- OFO-BB *Orneto-Ostryetum* Braun-Blanquet 1961 (northern Italy, Braun-Blanquet 1961, Tab. 53)

Results of these comparisons quite clearly demonstrate that in terms of floristic composition the syntaxa *Erico-Ostryetum*, *Querco-Ostryetum*, and *Cytantho-Ostryetum* from central and southeastern Slovenia and western Croatia, the syntaxa *Fraxino orni-Ostryetum* and *Cytantho-Ostryetum*

from the Alpine part of Slovenia and northeastern Italy and the association *Erico-Ostryetum* from southern Austria form separate groups. Two-dimensional ordination (Figures 4 and 5) in particular clearly shows that the floristic composition of the association *Erico-Ostryetum* from southern Austria resembles the floristic composition of the associations from the Alpine part of Slovenia and northeastern Italy much more than it resembles the floristic composition of the syntaxa from southeastern Slovenia and western Croatia. Classification of hop hornbeam and flowering ash communities from southern Austria into the association *Erico-Ostryetum* is therefore unfounded as these communities are floristically very different. Two groups of phytocoenoses can be differentiated based on this comparison. The southeastern-Alpine group of phytocoenoses is classified into the association *Fraxino orni-Ostryetum* Aichinger 1933 s. lat. (including the phytocoenoses of the association *Cytantho-Ostryetum*), while the southeastern-Slovenian and western-Croatian group of phytocoenoses is classified into the association *Querco-Ostryetum carpinifoliae* Horvat 1938 s. lat. (including the phytocoenoses of the association *Erico-Ostryetum* and the Croatian form of the association *Cytantho-Ostryetum*). The synthetic table (Table 5) indicates a group of differential species that well differentiate southeastern-Alpine hop hornbeam and flowering ash communities from the communities that were first described in Croatia. These differential species include *Campanula cespitosa*, *Primula auricula*, *Hieracium porrifolium*, *Asperula aristata*, *Allium ericetorum*, *Paederota lutea*, *Betonica alopecuros*, *Rhamnus fallax*, *Picea abies*, *Anemone trifolia*, *Laburnum alpinum*, *Valeriana tripteris*, *Rosa pendulina*, *Salix glabra*, *Salix appendiculata*, *Phyteuma orbiculare*, and, to a lesser extent, also, *Euphrasia cuspidata*, *Rhododendron hirsutum*, *Galium purpureum*, *Campanula carnica*, *Festuca calva*, *Saxifraga crustata*, *S. hostii*, *Potentilla caulescens*, *Aconitum angustifolium*. Partly diagnostic for Alpine hop-hornbeam stands is also *Sesleria caerulea* subsp. *calcaria*, but this species has also been recorded in the stands of the association *Querco-Ostryetum* in central and southeastern Slovenia (Zupančič et al., 2009). The species that are differential for the association *Querco-Ostryetum* s. lat. against the association *Fraxino orni-Ostryetum* s. lat. are *Genista januensis*, *Asperula cynanchica*, *Veronica jacquinii*, *Daphne cneorum*, *Dianthus giganteus* subsp. *croaticus*, *Helleborus atrorubens*, *Acer obtusatum*, *Quercus*

cerris, *Sorbus torminalis*, *Erythronium dens-canis*, *Silene nemoralis*, *Lonicera caprifolium*, *Melampyrum nemorosum*. *Quercus pubescens* is also partly differential for the association *Querco-Ostryetum*, although it sometimes grows, with a considerably lower medium coverage and constancy, also in Alpine phytocoenoses of hop hornbeam and flowering ash. Differences between two groups of ecologically similar phytocoenoses are demonstrated also in the composition by groups of diagnostic species (Table 6). Phytocoenoses of the association *Querco-Ostryetum* s. lat. have a higher proportion of diagnostic species of the order *Quercetalia pubescenti-petraeae*, while phytocoenoses of the association *Fraxino orni-Ostryetum* feature a higher proportion of diagnostic species of classes *Vaccinio-Piceetea*, *Elyno-Seslerietea*, *Thlaspietea rotundifolii*, and *Asplenietea trichomanis*. The proportion of species of the class *Erico-Pinetea* tends to be higher in phytocoenoses from the association *Fraxino-Ostryetum* s. lat.

Based on these findings we describe the studied stands of hop hornbeam and flowering ash from (north)western Slovenia. Table 1 incorporates the relevés from mainly sunny slopes on the southern outskirts of the Julian Alps (the Bača Valley, Tolmin, Kobarid and Bovec regions) and from the northern part of the Trnovski gozd plateau (the upper Idrijca) that are classified into the association *Fraxino orni-Ostryetum*. They are dominated by thermophilous species of classes *Quercetalia pubescenti-petraeae*, *Trifolio-Geranietea*, and *Festuco-Brometea* and species of beech and beech-oak forests. Pine forest species of the class *Erico-Pinetea* are more poorly represented in the stands of this syntaxon. Rockiness of the sites allows for the occurrence of many chasmophytic species (*Asplenietea trichomanis*). These relevés are classified into the thermophilous form of this association, temporarily classified as the variant *Fraxino orni-Ostryetum typicum* Franz et Willner 2007 var. *Arabis turrita*. Its differential species are also *Campanula rapunculoides* and *Quercus petraeae*. In some of their species, the stands of this variant show considerable resemblance to the stands of the association *Querco-Ostryetum*. Within this variant we also distinguish a subvariant with *Festuca calva* that characterises sunny rocky slopes in the montane belt of the Julian Alps at the elevations of around 1000 m and more. Relevés 1 to 16 in Table 2 are still classified into the same variant. Relevés 17 to 23 in this table were made on cold, shady slopes. Different ecological conditions are indicated by

Valeriana tripteris, *Veronica urticifolia*, *Rosa pendulina*, *Saxifraga cuneifolia*, *Picea abies*, *Homogyne sylvestris*, and in two relevés also by *Rhododendron hirsutum*. These relevés are classified into the variant *Fraxino orni-Ostryetum typicum* var. *Valeriana tripteris* and characterise a hop hornbeam community on colder sites. They also mark a transition of the typical subassociation towards the subassociation *Fraxino orni-Ostryetum rhododendretosum hirsuti* Franz & Willner 2007.

Relevés 1–28 in Table 3 are classified into the new subassociation *Fraxino orni-Ostryetum phyteumatetosum columnae* subass. nov. Its nomenclature type, *holotypus*, is relevé No. 7 in Table 3. This subassociation includes hop hornbeam and flowering ash stands on dolomite ridges and jags in the northern part of the Trnovski gozd plateau and in the foothills of the southern Julian Alps (the Cerkno region) that are more common on shady than on sunny aspects (Figure 7). The subassociation is named after the southern-Alpine-northern-Ilyrian taxon *Phyteuma scheuchzeri* subsp. *columnae*, which is a character species of chasmophytic communities from the southern-Alpine alliance *Phyteumato-Saxifragion petraeae* and order *Potentilletalia caulescentis*. In Slovenia, it most frequently grows in the foothills of the southern Julian Alps and in the northern part of the Dinaric Alps (Banjšice, the Trnovski gozd plateau, Nanos), so it is a good indicator of phytocoenoses of the studied association between the Alps and the Dinarides. The differential species of the subassociation are also *Mercurialis ovata*,

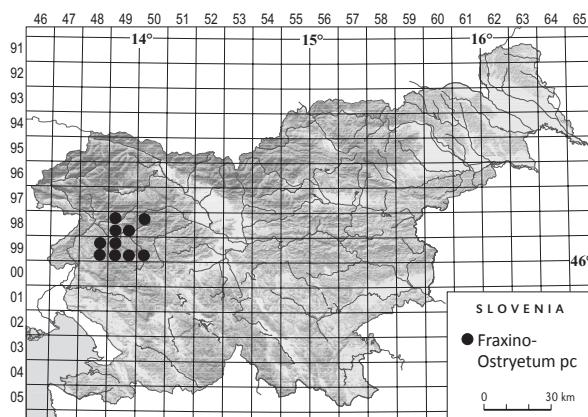

Figure 7: Approximate localities of the stands of the subassociation *Fraxino orni-Ostryetum phyteumatetosum columnae* studied in Slovenia.

Slika 7: Približna nahajališča sestojev subasociacije *Fraxino orni-Ostryetum phyteumatetosum columnae* na zemljevidu Slovenije.

Genista januensis, *Cotinus coggygria*, *Salvia pratensis* subsp. *saccardiana*, *Scabiosa hladnikiana*, *Primula carniolica*, *Potentilla carniolica*, *Omphalodes verna*, *Daphne alpina*. The listed species, especially northern-Illyrian endemics (*Primula carniolica*, *Potentilla carniolica*, *Scabiosa hladnikiana*) and southeastern-Alpine-northern-Illyrian taxa *Salvia pratensis* subsp. *saccardiana* and *Omphalodes verna*, characterise the stands of the new association in terms of phytogeography. Others, *Genista januensis*, *Mercurialis ovata*, *Cotinus coggygria*, indicate a certain similarity with the stands of the Dinaric-pre-Dinaric association *Querco-Ostryetum*. *Rhododendron hirsutum*, *Laserpitium peucedanoides*, and *Rhodothamnus chamaecistus*, which are also classified as the differential species of the new subassociation, indicate both an unquestionable affinity with the southeastern-Alpine hop hornbeam community and the specific features of the sites (predominantly shady aspect). Similarity with phytocoenoses in the Julian Alps is further corroborated by the relevés made in the Tolmin and Bohinj part of the Julian Alps, namely relevés No. 29 to 32 in Table 3, which in hierarchical classification are grouped with the stands of the subassociation *-phyteumatetosum columnae* and comprise most of the species of the new subassociation save some phytogeographical differential species (northern-Illyrian endemics). For the time being, these four relevés are classified into the typical subassociation (*Fraxino orni-Ostryetum typicum* Franz & Willner 2007).

According to the results of hierarchical classification (Figure 3), stands in phytosociological Table 4 could still be classified into the syntaxon *Fraxino orni-Ostryetum* as the subassociation *-rhododendretosum hirsuti* Franz & Willner 2007. Results of the two-dimensional ordination (Figures 4 and 5) and the analysis according to the groups of diagnostic species (Table 6) on the other hand, imply the possibility that these phytocoenoses could be classified into another association. They comprise a considerably higher proportion of beech forest species (*Fagetalia sylvatica*, *Arenonio-Fagion*, *Tilio-Acerion*, *Querco-Fagetea*) – in total about 30 % – than other compared syntaxa. These phytocoenoses also comprise the highest proportion of diagnostic species of spruce forests (*Vaccinio-Piceetea*) – 11%. In the studied phytocoenoses, diagnostic species of beech forests therefore outweigh the proportion of diagnostic species of thermophilous oak forests from the order *Quercetalia pubescenti-petraeae*, as well as the

proportion of basophilous pine forests of the class *Erico-Pinetea*. According to our findings, relevés in Table 4 identify above all hop hornbeam stands on steep shady slopes in the beech forest belt and in some cases most likely represent a long-term degradation stage on potential beech sites from the associations *Rhododendro hirsuti-Fagetum*, *Anemono-Fagetum*, and (or) *Arundo-Fagetum*. We propose they be classified into the new association *Rhododendro hirsuti-Ostryetum* Franz ex Dakskobler ass. nov. hoc loco. They were recorded in the Julian Alps: Maklenova peč above the Limarica in the Trenta Valley, above the stream Žila in the Učja valley, Dol po Meji / Valle di Musi – under Muzci / Cime del Monte Musi (Italy – relevé No. 1 in Table 4), Struje and Pod Sopotom above the Zadlaščica valley, Treska at Srpenica, in the Cerkno and Idrija Hills: Zakojška grapa gorge, Drnova, Mali Njivč, Šebrelje – Sv. Ivan, above the homestead Jelenk in the valley of Hostenja, Klavžarica in the Kanomlja valley and on the northern edge of the Trnovski gozd plateau above the valleys of the Idrijca (Skopica) and the Trebušica (Gradov rob, Krtovše, Poldanovec) – Figure 8. Its sites in central Slovenia were discussed by Accetto (2008, 2013), two relevés were already published (Dakskobler et al. 2011).

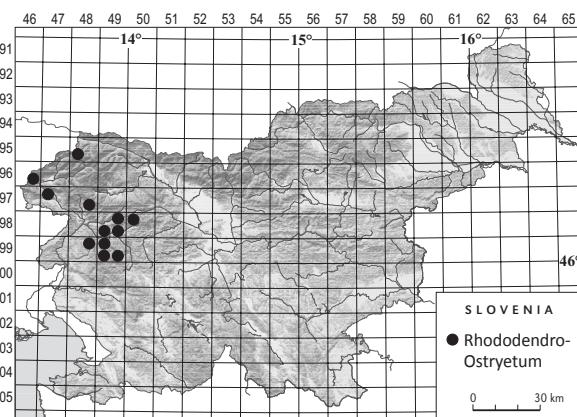

Figure 8: Approximate localities of stands of the association *Rhododendro hirsuti-Ostryetum* in (north)western Slovenia.
Slika 8: Približna nahajališča sestojev asociacije *Rhododendro hirsuti-Ostryetum* v (severo)zahodni Sloveniji.

Franz (2002: 257) classified the association with the name *Rhododendro hirsuti-Ostryetum* ass. prov. into the alliance *Erico-Pinion mugo*, class *Erico-Pinetea*. In his provisional description Franz stresses the similarity and syndynamic affinity of this association with the stands of the association *Erico carnea-Pinetum prostratae*. He published the

relevé on rockfall in Rož in southern Carinthia (Jama) in the northern foothills of the Karavanke Mts. as a typical relevé of this association, but not as a holotype. The diagnostic or dominant and the most frequent species of the association *Rhododendro-Ostryetum* Franz 2002 nom. prov. are *Ostrya carpinifolia*, *Fraxinus ormus*, *Sorbus aria*, *Erica carnea*, *Cyclamen purpurascens*, *Amelanchier ovalis*, *Calamagrostis varia*, *Polygala chamaebuxus*, *Campanula cespitosa*, *Cirsium erisithales*, *Rhamnus fallax*, *Rhododendron hirsutum*, *Pinus mugo*, *Paederota lutea*, and *Valeriana saxatilis*. Species with a lower constancy of below 40% comprise *Pinus sylvestris*, *Sesleria caerulea* subsp. *calcaria*, *Salix glabra*, and *Gymnocarpium robertianum*. Franz & Willner (2007a: 86) subsequently lowered the rank of this provisional association to the rank of subassociation and described it as a new subassociation *Eri-co-Ostryetum* Horvat 1959 *rhododendretosum hirsuti* Franz & Willner 2007. The differential species of the new subassociation are *Rhododendron hirsutum*, *Valeriana triptera*, *Rhamnus fallax*, *Petasites paradoxus*, *Paederota lutea*, *Salix glabra* and *Pinus mugo*. Its stands grow on steep, shady, stable scree slopes in the lower montane belt. Of the listed diagnostic species of the syntaxon *Eri-co-Ostryetum rhododendretosum*, *Pinus mugo* and *Petasites paradoxus* were hardly ever recorded in the studied phytocoenoses whereas other species occurred more or less frequently in our relevés. However, results of hierarchical classification do not group our relevés with the relevés of the subassociation *Eri-co-Ostryetum rhododendretosum* from southern Austria. The new association *Rhododendro hirsuti-Ostryetum carpinifolie* Franz ex Dakskobler ass. nov. hoc loco therefore cannot be typified based on the relevé published by Franz (2002: 157) and relevé No. 19 in Table 4 was selected as its nomenclature type, *holotypus* hoc loco. Considering the dominant species of the tree layer, the new association is still classified into the alliance *Fraxino orni-Ostryion* and order *Quercetalia pubescenti-petraeae*; also possible is its classification into the alliance *Aremonio-Fagion* and order *Fagetalia sylvatica*. It therefore incorporates hop hornbeam and flowering ash phytocoenoses on calcareous bedrock (dolomite, dolomite limestone, dolomite with chert, limestone with chert, rarely also talus), with moder rendzina (rarely also lithosol or colluvial-delluvial soils) on very steep (30° do 50°) shady (northern, northeastern, northwestern), exceptionally also sunny slopes in the submontane and montane belt (from about 300

to about 1100 m a.s.l.) in the Julian Alps, in the Prealpine Hills and in the northern part of the Dinaric Alps. These stands are, at least in part, of secondary origin on potential beech sites. Diagnostic species of the new association are *Rhododendron hirsutum*, *Rosa pendulina*, *Salix appendiculata*, *Fagus sylvatica*, *Acer pseudoplatanus*, *Gymnocarpium robertianum*, *Adenostyles glabra*, *Valeriana saxatilis* and *Carex ferruginea*.

Based on the relevés in Table 4 the new association is divided into two lower units. The stands comprising a large proportion of frigophilous species, character species of the class *Vaccinio-Piceetea* and diagnostic species of beech forests are classified into the subassociation *Rhododendro-Ostryetum mercurialietosum perennis* subass. nov. hoc loco. Its nomenclature type, *holotypus*, is relevé No. 19 in Table 4. The differential species of the new subassociation are *Mercurialis perennis*, *Laburnum alpinum*, *Hieracium murorum*, *Lathyrus vernus* subsp. *vernus* and *Lathyrus vernus* subsp. *flaccidus*. In this subassociation we also distinguish the variant with *Homogyne sylvestris*, whose differential species are, among others, *Salvia glutinosa* and *Carex ferruginea* and which characterises the most frigophilous stands of the new association on fresh sites with moder rendzina. Relévé No. 1 to 10 are temporarily classified into the variant *Rhododendro hirsuti-Ostryetum* var. *Hemerocallis lilioasphodelus*. Its stands grow on dolomite bedrock and are slightly more similar to the stands of the association *Fraxino orni-Ostryetum*. The taxa *Molinia caerulea* subsp. *arundinacea* and *Hemerocallis lilioasphodelus* often dominate in the herb layer. Floristic composition of the stands of this variant indicates considerable similarity with the stands of the association *Hemerocallido-Ostryetum* Poldini 1982 which Poldini (1982) described on very steep, shady limestone slopes in the Carnian Prealps and classified into the alliance *Aremonio-Fagion*. Floristic similarity between them according to Sørensen (1948) is 54%, which even allows their classification into this association. In the stands of the variant *Rhododendro-Ostryetum* var. *Hemerocallis lilioasphodelus*, we did not record two diagnostic species of the association *Hemerocallido-Ostryetum*, *Adenophora liliifolia* and *Aconitum lycoctonum*, and some other species such as *Coronilla emerus*, *Rubus caesius* and *Tilia cordata*. Some other species that are absent from the relevés of the association *Hemerocallido-Ostryetum*, e.g., *Valeriana saxatilis*, *Carex digitata*, *Polygala chamaebuxus*, *Vincetoxicum hirundinaria*,

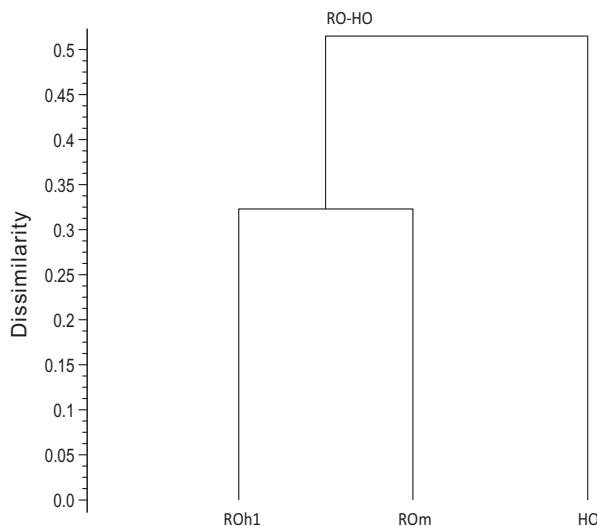

Figure 9: Dendrogram of the stands of the syntaxa *Rhododendro hirsuti-Ostryetum* var. *Hemerocallis lilioasphodelus* (ROhl), *Rhododendro hirsuti-Ostryetum mercurialietosum perennis* (ROm), and *Hemerocallido-Ostryetum* (HO) – UPGMA, similarity ratio.

Slika 9: Dendrogram sestojev sintaksonov *Rhododendro hirsuti-Ostryetum* var. *Hemerocallis lilioasphodelus* (ROhl), *Rhododendro hirsuti-Ostryetum mercurialietosum perennis* (ROm) in *Hemerocallido-Ostryetum* (HO) – UPGMA, similarity ratio.

Anthericum ramosum, *Phyteum orbiculare*, *Senecio ovatus*, and others, also occur in the relevés of the variant *Rhododendro-Ostryetum* var. *Hemerocallis lilioasphodelus*. Stands of the associations *Hemerocallido-Ostryetum* and *Rhododendro hirsuti-Ostryetum* grow in the Southeastern Alps and their foothills, in very similar site conditions (steep shady slopes in the beech forest belt), and the variant *Rhododendro hirsuti-Ostyretum* var. *Hemerocallis lilioasphodelus* is an example of a transitional form between them that can be classified, based on its floristic composition, into either of these two associations. Other relevés of the association *Rhododendro hirsuti-Ostryetum*, however, cannot be included in the association *Hemerocallido-Ostryetum*; firstly, because one of the diagnostic species of this association, *Hemerocallis lilioasphodelus*, occurs only in one of 25 relevés, and secondly, because the other two, *Adenophora liliifolia* and *Aconitum lycoctonum* are completely absent from them. There are also many other floristic differences between their stands. This is further corroborated by the numerical comparison of floristic similarity of the three mentioned syntaxa (Figure 9).

4. CONCLUSIONS

We have established that hop hornbeam and flowering ash communities from the Southeastern Alps and their foothills (two associations were described here, *Ostryo-Fraxinetum orni* Aichinger 1933 and *Cytisantho-Ostryetum* M. Wraber 1961) are floristically slightly similar to hop hornbeam, flowering ash, and pubescent oak communities from central and southeastern Slovenia and western Croatia (where we described the associations *Querco-Ostryetum carpinifoliae* Horvat 1938 and *Erico-Ostryetum* Horvat 1959). Nevertheless, hierarchical classification made on the basis of the synthetic table and the analysis of proportions of diagnostic species demonstrate obvious differences. Species diagnostic for southeastern-Alpine hop hornbeam and flowering ash communities are *Campanula cespitosa*, *Primula auricula*, *Hieracium porrifolium*, *Asperula aristata*, *Allium ericetorum*, *Paederota lutea*, *Betonica alopecuros*, *Rhamnus fallax*, *Picea abies*, *Anemone trifolia*, *Laburnum alpinum*, *Valeriana tripteris*, *Rosa pendulina*, *Salix glabra*, *Salix appendiculata*, *Phyteuma orbiculare*, *Euphrasia cuspidata*, *Rhododendron hirsutum*, *Galium purpureum*, *Campanula carnica*, *Festuca calva*, *Saxifraga crustata*, *S. hostii*, *Potentilla caulescens*, *Aconitum angustifolium*, and (partly) *Sesleria caerulea* subsp. *calcaria*. The species that are differential for the association *Querco-Ostryetum* s. lat. against the association *Fraxino orni-Ostryetum* s. lat. are *Genista januensis*, *Asperula cynanchica*, *Veronica jacquinii*, *Daphne cneorum*, *Dianthus giganteus* subsp. *croaticus*, *Helleborus atrorubens*, *Acer obtusatum*, *Quercus cerris*, *Sorbus torminalis*, *Erythronium dens-canis*, *Silene nemoralis*, *Lonicera caprifolium*, *Melampyrum nemorosum*, and (partly) *Quercus pubescens*.

Through our comparison we determined that the floristic composition of hop hornbeam and flowering ash stands from southern Austria that Franz & Willner (2007a) classified into the association *Erico-Ostryetum* Horvat 1959 is more similar to the floristic composition of associations from the Alpine part of Slovenia and northeastern Italy than to the floristic composition of syntaxa from southeastern Slovenia and western Croatia. Classification of hop hornbeam and flowering ash communities from southern Austria into Horvat's association *Erico-Ostryetum* is unfounded as these communities are floristically very different. In addition, we do not think that the name

Ostryo-Fraxinetum orni Aichinger 1933 is a *nomen ambiguum* as interpreted by Franz & Willner (2007a); rather, the name *Orneto-Ostryetum* Braun-Blanquet 1961 is a later homonym that should be rejected (Weber et al. 2000, Art. 31, p. 753).

The comparisons described herein served as the basis upon which we classified most of more than 100 relevés of hop hornbeam and flowering ash phytocoenoses on steep rocky sites in the beech forest belt in the Julian Alps and their foothills and on the northern edge of the Trnovski gozd plateau into the association *Fraxino orni-Ostryetum*. Hop hornbeam and flowering ash stands of steep shady slopes of submontane and montane belt where the proportion of beech forest species (*Fagetalia sylvaticae*, *Aremonio-Fagion*, *Tilio-Acerion*, *Querco-Fagetea*) exceeds both the proportion of diagnostic species of thermophilous oak forests (*Quercetalia pubescenti-petraeae*) and the proportion of species of basophilous pine forests (*Erico-Pinetea*), and which encompass many frigophilous spruce forest species (*Vaccinio-Piceetea*), are classified into the new association *Rhododendro hirsuti-Ostryetum* Franz ex Dakskobler ass. nov. hoc loco. These stands are, at least in part, a long-term stage of degradation on potential beech sites. The new association is divided into two subunits; the stands of the first (*Rhododendro hirsuti-Ostryetum* var. *Hemerocallis lilioasphodelus*) are floristically rather similar to the stands of the association *Hemerocallido-Ostryetum*.

The hop hornbeam and flowering ash stands described are exclusively protective. They protect lower-lying areas against erosion, falling rocks and rockfall. Also significant is their role as a biotope as they serve as the site of some rare and (or) protected phanerograms (Anon. 2002, 2004), such as *Epipactis atrorubens*, *E. muelleri*, *E. helleborine*, *Cephalanthera longifolia*, *C. rubra*, *C. damasonium*, *Ophrys insectifera*, *Hemerocallis lilioasphodelus*, *Ilex aquifolium*, *Primula auricula*, *Iris pallida* subsp. *cengialti*, *Sedum maximum*, *Dianthus hyssopifolius* (= *D. monspessulanus*), *D. sylvestris*, *Gentiana lutea* subsp. *sympyandra*, *Platanthera bifolia*, *Daphne blagayana*, *Listera ovata*, *Lilium carniolicum*, *Sempervivum tectorum*, *Taxus baccata*, *Viola pyrenaica*, *Orobanche teucrii*, and *Veratrum nigrum*. They also comprise some endemic species, e.g., *Aconitum angustifolium*, *Medicago pironiae*, *Scabiosa hladnikiana*, *Moehringia villosa*, *Primula carniolica*, *P. x venusta*, and *P. x ternovania*.

Synsystematic classification of the studied communities into higher units is as follows:

Class: *Querco-Fagetea* Br.-Bl. et Vlieger 1937

Order: *Quercetalia pubescenti-petraeae* Klika 1933

Alliance: *Fraxino orni-Ostryetum* Tomažič 1940

5. POVZETEK

Fitocenološka oznaka združb črnega gabra (*Ostrya carpinifolia*) in malega jesena (*Fraxinus ornus*) v Julijskih Alpah in severnem delu Dinarskega gorstva (severozahodna in zahodna Slovenija, severovzhodna Italija)

Ugotavljamo, da so združbe črnega gabra in malega jesena iz Jugovzhodnih Alp s prigorjem (tu sta bili opisani dve asociaciji *Ostryo-Fraxinetum orni* Aichinger 1933 in *Cytantho-Ostryetum* M. Wrauber 1961) floristično nekoliko podobne združbam črnega gabra, malega jesena in puhastega hrasta iz osrednje in jugovzhodne Slovenije in zahodne Hrvaške (tu sta bili opisani asociaciji *Querco-Ostryetum carpinifoliae* Horvat 1938 in *Erico-Ostryetum* Horvat 1959). Kljub temu hierarhična klasifikacija na podlagi sintezne tabele in analiza deležev diagnostičnih vrst kaže očitne razlike. Diagnostične vrste za jugovzhodnoalpske združbe črnega gabra in malega jesena so *Campanula cespitosa*, *Primula auricula*, *Hieracium porrifolium*, *Asperula aristata*, *Allium ericetorum*, *Paederota lutea*, *Betonica alopecuros*, *Rhamnus fallax*, *Picea abies*, *Anemone trifolia*, *Laburnum alpinum*, *Valeriana tripteris*, *Rosa pendulina*, *Salix glabra*, *Salix appendiculata*, *Phyteuma orbiculare*, *Euphrasia cuspidata*, *Rhododendron hirsutum*, *Galium purpureum*, *Campanula carnica*, *Festuca calva*, *Saxifraga crustata*, *S. hostii*, *Potentilla caulescens*, *Aconitum angustifolium* in (de-loma) *Sesleria caerulea* subsp. *calcaria*. Vrste, ki so razlikovalne za asociacijo *Querco-Ostryetum* s. lat. nasproti asociacije *Fraxino orni-Ostryetum* s. lat. so *Genista januensis*, *Asperula cynanchica*, *Veroni-*

ca jacquinii, *Daphne cneorum*, *Dianthus giganteus* subsp. *croaticus*, *Helleborus atrorubens*, *Acer obtusatum*, *Quercus cerris*, *Sorbus torminalis*, *Erythronium dens-canis*, *Silene nemoralis*, *Lonicera caprifolium*, *Melampyrum nemorosum* in (deloma) *Quercus pubescens*.

S primerjavo smo ugotovili, da je floristična sestava sestojev črnega gabra in malega jesena iz južne Avstrije, ki sta jih Franz & Willner (2007a) uvrstila v asociacijo *Erico-Ostryetum* Horvat 1959, bolj podobna floristični sestavi asociacij iz alpskega dela Slovenije in severovzhodne Italije, kot pa floristični sestavi sintaksonov iz jugovzhodne Slovenije in zahodne Hrvaške. Uvrstitev združb črnega gabra in malega jesena iz južne Avstrije v Horvatovo asociacijo *Erico-Ostryetum* ni utemeljena, ker gre za floristično preveč različne združbe. Poleg tega menimo, da ime *Ostryo-Fraxinetum orni* Aichinger 1933 ni *nomen ambiguum*, kot ga tolmačita Franz & Willner (2007a), pač pa je ime *Orneto-Ostryetum* Braun-Blanquet 1961 poznejši homonim, ki ga je treba zavreči (Weber et al. 2000, Art. 31, p. 753).

Opisane primerjave so bile podlaga, da smo večino od več kot 100 fitocenoloških popisov fitocenoz črnega gabra in malega jesena na strmih skalnatih rastiščih v pasu bukovih gozdov v Julijskih Alpah s prigorjem in na severnem robu Trnovskega gozda uvrstili v asociacijo *Fraxino orni-Ostryetum*. Sestoje črnega gabra in malega jesena na strmih osojnih pobočjih podgorskega in gorskega pasu, v katerih delež vrst bukovih gozdov (*Fagetalia sylvaticae*, *Aremonio-Fagion*, *Tilio-Acerion*, *Querco-Fagetea*) presega delež diagnostičnih vrst toploljubnih hrastovih gozdov (*Quercetalia pubescenti-petraeae*) in tudi delež vrst bazofilnih borovih gozdov (*Erico-Pinetea*), v njih pa je precej hladnljubnih vrst smrekovih gozdov (*Vaccinio-Piceetea*), uvrščamo v novo asociacijo *Rhododendro hirsuti-Ostryetum* Franz ex Dakskobler ass. nov. hoc loco. Vsaj deloma so njeni sestoji dolgorajen degradacijski stadij na potencialno bukovih rastiščih. Novo asociacijo členimo na dve podenoti, med katerima so sestoji ene (*Rhododendro hirsuti-Ostryetum* var. *Hemerocallis lilioasphodelus*) floristično precej podobni sestojem asociacije *Hemerocallido-Ostryetum*. V naših sestojih nismo popisali dveh diagnostičnih vrst te asociacije, *Adenophora liliifolia* in *Aconitum lycoctonum* in še nekaterih drugih vrst kot so *Coronilla emerus*, *Rubus caesius* in *Tilia cordata*, v njih pa našli tudi nekatere vrste, ki jih ni v popisih sestojev asociacije *Hemerocallido-Ostryetum* (na primer *Valeria-*

na saxatilis, *Carex digitata*, *Polygala chamaebuxus*, *Vincetoxicum hirundinaria*, *Anthericum ramosum*, *Phyteum orbiculare*, *Senecio ovatus*).

Opisani sestoji črnega gabra in malega jasena so izključno varovalni. Varujejo nižje ležeča območja pred erozijo in padajočim kamenjem ter skalnimi podori. Pomembna je njihova biotopska vloga, saj so rastišče nekaterih redkih in (ali) varovanih semenek (Anon. 2002, 2004), kot so vrste *Epipactis atrorubens*, *E. muelleri*, *E. helleborine*, *Cephalanthera longifolia*, *C. rubra*, *C. damasonium*, *Ophrys insectifera*, *Hemerocallis lilioasphodelus*, *Ilex aquifolium*, *Primula auricula*, *Iris pallida* subsp. *cengialti*, *Sedum maximum*, *Dianthus hyssopifolius* (= *D. monspessulanus*), *D. sylvestris*, *Gentiana lutea* subsp. *symphyandra*, *Platanthera bifolia*, *Daphne blagayana*, *Listera ovata*, *Lilium carniolicum*, *Sempervivum tectorum*, *Taxus baccata*, *Viola pyrenaica*, *Orobanche teucrii* in *Veratrum nigrum*. V njih rasteju tudi nekatere endemične vrste, na primer *Aconitum angustifolium*, *Medicago pironae*, *Scabiosa hladnikiana*, *Moehringia villosa*, *Primula carniolica*, *P. x venusta* in *P. x ternovania*.

Sinsistematska uvrstitev obravnavanih združb v višje enote je naslednja:

Razred: *Querco-Fagetea* Br.-Bl. et Vlieger in Vlieger 1937

Red: *Quercetalia pubescenti-petraeae* Klika 1933

6. ACKNOWLEDGEMENTS

Phytosociological processing of hop hornbeam communities was partly conducted in the framework of the target research project of updating of the vegetation system for the forest management planning purposes (Posodobitev sistema vegetacijskih osnov za potrebe načrtovanja v gozdarstvu, V4-1141), funded by the Slovenian

Research Agency and Ministry of Agriculture and the Environment. Two anonymous reviewers helped me with valuable improvements and corrections. English translation by Andreja Šalamon Verbič.

3 – EOsg: *Erico-Ostryetum* Horvat 1959 *silenosum glareosae* (Franz) Franz & Willner 2007 (Austria, northern Slovenia, Franz & Willner 2007b, Table 13, column 2)

4 – EOhr: *Erico-Ostryetum* Horvat 1959 *rhododendretosum hirsuti* (Franz) Franz & Willner 2007 (Austria, northern Slovenia, Franz & Willner 2007b, Table 13, column 3)

5 – RO: *Rhododendro hirsuti-Ostryetum* Franz ex Dakskobler ass. nov. (north)western Slovenia

6, 7, 8 – OFO1, OFO2, OFO3: *Fraxino orni-Ostryetum* Aichinger 1933, (north)western Slovenia

9 – OFO-It: *Ostryo carpinifoliae-Fraxinetum orni* Aichinger 1933 (northeastern Italy, Poldini & Vidali 1999, Table 1)

10 – CyO-SI: *Cytisanthro-Ostryetum* M. Wraber 1961 (Bohinj, M. Wraber 1961, phytosociological table, relevés 1 to 11)

11 – CyO-HR: *Cytisanthro-Ostryetum* M. Wraber 1961 (western Croatia, Samobor Hills, Šugar 1978, Table 1)

12 – EO-HR: *Erico-Ostryetum* Horvat 1959 (western Croatia, Horvat 1959, Table 2, column 12)

13 – QO-HR: *Querco-Ostryetum carpinifoliae* Horvat 1938 (Croatia, Horvat 1938, Table 1, relevés 1 to 11)

14 – QO-SI: *Querco-Ostryetum carpinifoliae* Horvat 1938 (central and southeastern Slovenia, Zupančič et al. 2009, Table 1, relevés 1 to 26)

Table 6: Groups of diagnostic species in the syntaxa *Fraxino orni-Ostryetum* s. lat. and *Querco-Ostryetum* s. lat.
Tabela 6: Skupine diagnostičnih vrst v sintaksonih *Fraxino orni-Ostryetum* s. lat. in *Querco-Ostryetum* s. lat.
